Topic overview

About Menerga

Since the company was founded, we have been pursuing our philosophy „We create a good climate - through minimal energy application“ on a daily basis. We are proud to have been one of the first companies in the industry to focus on energy efficiency from the very beginning and to continue to find new sustainable solutions in the future. Our systems are the result of high-quality, intelligent engineering and craftsmanship.

Technical Information

Swimming Pool

Aquaculture

Minimal Energy Application

With over 40,000 units installed worldwide, we cover almost every area of application. We don't just sell the units, but offer you our years of experience. In the search for the best solution, we analyse the specific conditions on site together with you and find the optimal solution. Can an alternative energy source perhaps still be used to further reduce operating costs?

Net-zero energy buildings

Special Applications

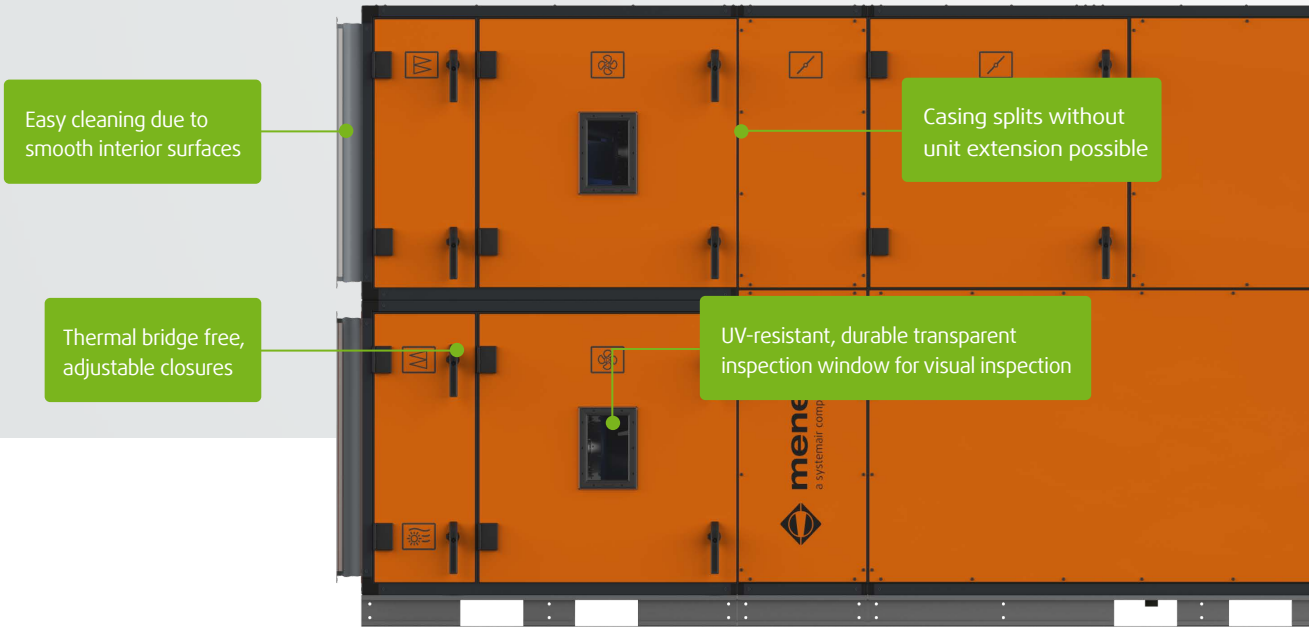
Orange is green

Next Generation

New unit casing
After more than 40 years, we are taking the next step with the unit casing. Our new casing meets the highest standards, has a distinctive, practical design and, above all, provides even more flexibility and quality.

Why a new casing?
With our new *Next Generation** case, we have redefined quality standards. The development of the new casing generation has been significantly influenced by customer wishes and production requirements. And we remain true to our corporate philosophy: Menerga - **M**inimum **Energ**y **A**pplication.

What are the new benefits?
Above all, the modular design enables individual use of the ventilation and air-conditioning technology. Our new casing offers numerous advantages such as high flexibility, consistent avoidance of thermal bridges in all areas and easy cleaning thanks to smooth surfaces on the inside.



Corrosion protection class **C4**

Individual → Modular design

Reliable → Thermal bridge factor TB1 according to DIN EN 1886

Unique → Best characteristics in a wide range of application areas

Will the MB50 casing still be available in the future?
Starting with our core competence, indoor swimming pool air treatment, we will successively adapt our units in the individual application areas. In the meantime, both types of casing are available.

Eurovent Certita Certification is recognized as a world leader in third-party product performance certification in the Heating, Ventilation, Air Conditioning, and Refrigeration fields. Based on a voluntary approach, our certification schemes are open to all manufacturers and distributors.

TX Casing

New unit casing for private and small swimming pools
Menerga's new TX casing offers even better energy efficiency and an even wider range of application possibilities. Standardised and flexible design reduces lead times and ensures short delivery times and effortless installation. These are a few of the things that make TX not only right for your building's air flow but also for the work flow.

The Menerga control system makes it simple to connect, configure and control TX units and handle multiple units via a cloud service. The TX range comes in five sizes and a variety of standard configurations. It can be combined with re-heaters, domestic heat pump coupling and various control functions.

Simple installation and reassemble on-site
All models are dimensioned for smooth installation.

Easy → Selection, assembly and intuitive control system

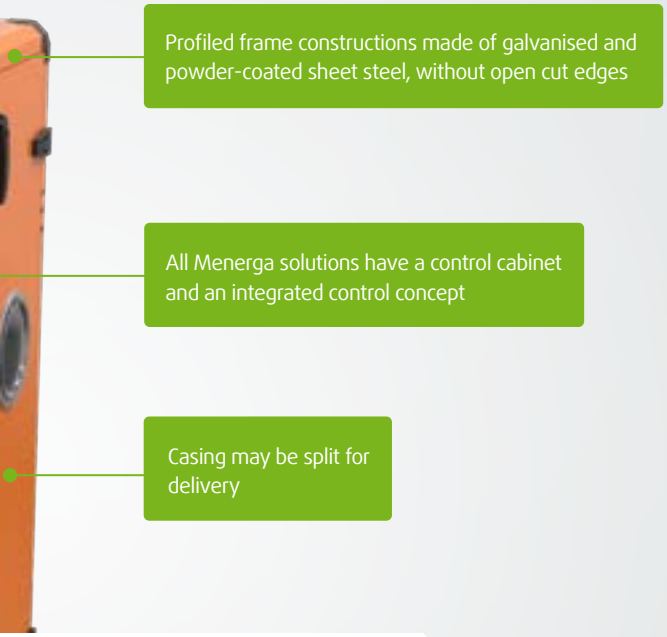
Compact → Minimum space requirement with efficient performance

Quick → Wide range of standardised units with fast delivery

All TX sizes are available as split units and designed to be easy to dismantle and reassemble on site.

Designed for easy service and maintenance
The design enables easy access for inspection, maintenance and cleaning of all exposed surfaces through the large inspection doors. Construction methods and component materials are selected to easily maintain the interior and functionality of the air handling unit.

A design without exposed sharp edges ensures that surfaces can be safely cleaned. Main components are also easily removable for cleaning and servicing. To allow an comfortable maintanance in small technical rooms the doors can be easily removed.



Rating systems and certificates

The quality of good air

As a leading manufacturer of air conditioning and ventilation systems, we at Menerga place a special focus on indoor air quality. Our innovative solutions ensure a healthy and pleasant indoor climate in offices, public facilities and industrial plants.

Why is air quality so important?
Optimal air quality is crucial for people's well-being, productivity and health. Poor air can lead to lack of concentration, fatigue and even health problems. That's why Menerga develops solutions that ensure a continuous supply of fresh air and efficiently remove pollutants to create a healthy indoor environment.

Our commitment to sustainability and quality:
At Menerga, customer satisfaction is our number one priority. We are committed to ensuring that our products not only meet the strictest industry standards, but also exceed our customers' expectations. Our environmentally friendly solutions help reduce energy consumption and minimise CO_2 emissions.

More information?

www.menerga.com

Empowering Sustainable Buildings:
At Menerga we are proud to offer innovative high performance air handling units that not only meet the highest technical standards, but also the requirements of the most prestigious building certifications such as LEED, BREEAM and Well Being. Our long-standing expertise and commitment to sustainability enables us to provide solutions that meet the highest standards of building efficiency and environmental performance.

Leed: Leadership in Energy and Environmental Design (LEED) is a green building rating system developed by the U.S. Green Building Council in 1998.

BREEAM®

BREEAM is a rating system for the sustainability of buildings and real estate that has been in practice since 1990. The system was developed to reduce the environmental impact of buildings, improve the quality of life of users and increase the value of real estate in the long term.

Well Building Institute (IWBI) is an international system provider for the WELL Building Standard (WELL), the first rating system that focuses exclusively on the goal of positively influencing the comfort, health and well-being of users through the design of buildings and interior spaces.

Passive house

Highest energy efficiency

Passive house explained:
The passive house is one of the most energy-efficient forms of construction. A building standard that is energy-efficient, comfortable, economical and environmentally friendly at the same time.

The certification of Passive Houses ensures that the high quality requirements of the Passive House Standard are achieved. This can be seen as an overall concept, as it covers construction right through to operation. This also includes, for example, ventilation systems, which can be certified by the Institute. An essential component in the certification of the entire building is the ventilation units.

These help to ensure that the "passive house criteria" such as the heating energy requirement of no more than 15 kWh/m^2-a and the primary energy requirement of less than 120 kWh/m^2-a are met with an airtightness of at least n50 = 0.6 /h. To achieve this, not only an airtight construction with very good thermal insulation is necessary, but also highly efficient equipment technology. The compulsory ventilation system must not exceed 0.45 Wh/m^3 electrical input power with a heat recovery efficiency of at least 75 % at -10 °C OA and 21 °C RA.

Menerga solutions

Passive House certified components

NX Resolair:
Low energy unit with highly efficient regenerative heat storage

NX Adconair:
Low energy unit with counterflow plate heat exchanger

Passive House certified ventilation units:
An essential component of the passive house concept is air treatment with highly efficient heat recovery. Our Menerga Resolair 64 and NX Adconair series are official passive house certified components and are therefore ideal for use in passive houses and all other low-energy buildings.

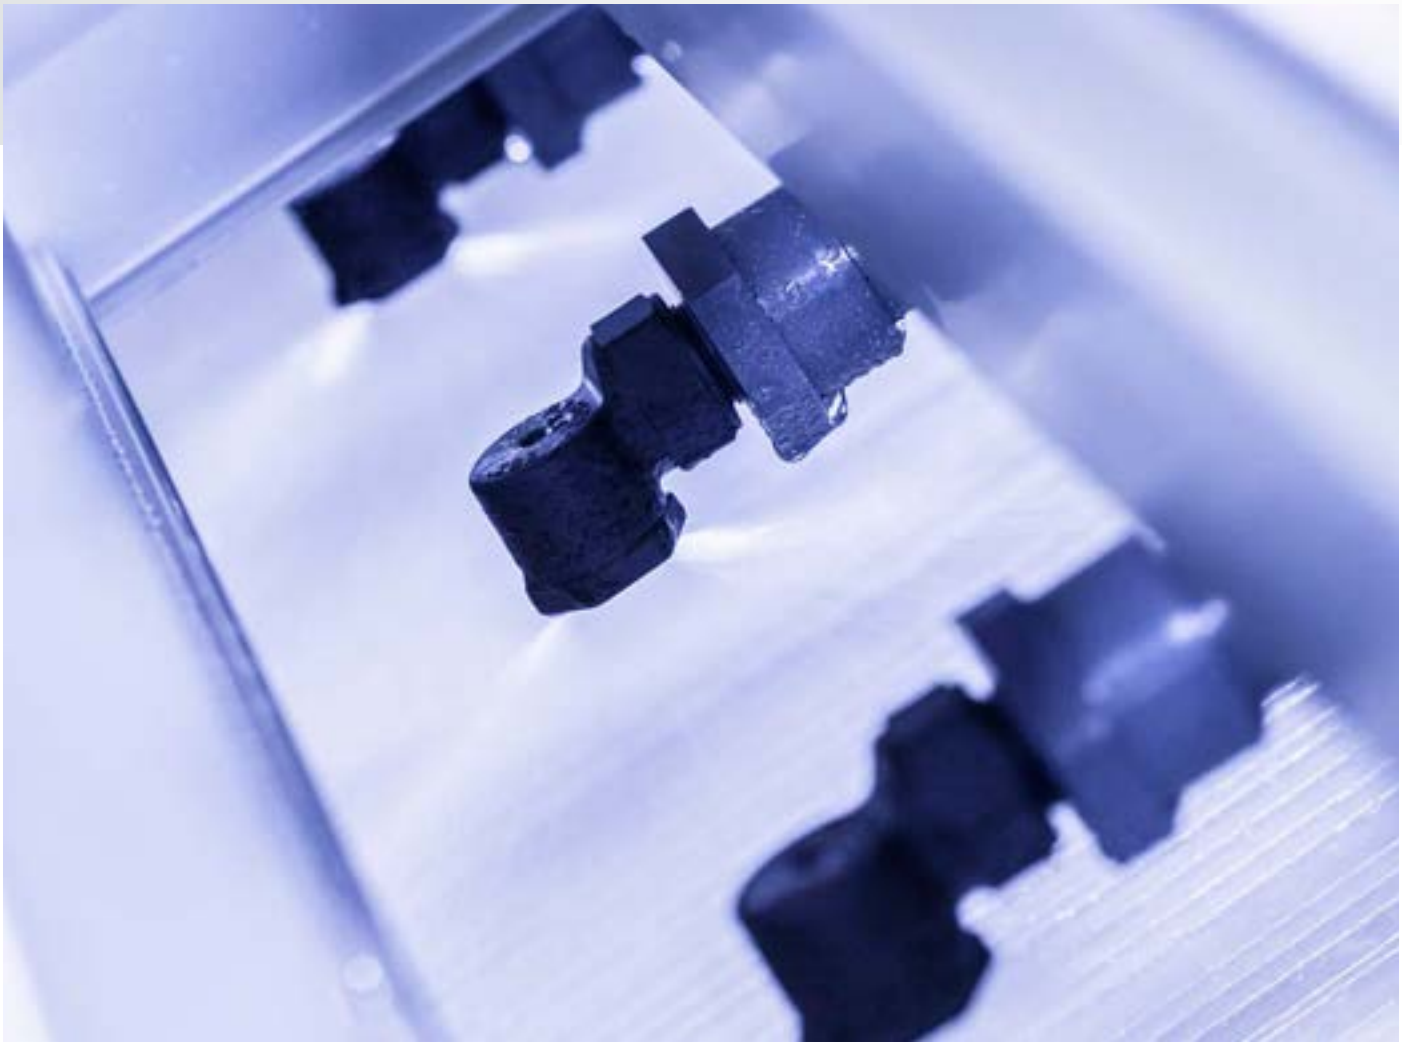
What is adiabatic cooling?

Inspired by nature:
Adiabatic evaporative cooling is a very efficient principle that can be found in nature. It makes use of the physical effect when water evaporates it removes thermal energy from the air, which cools it down. Everybody has experienced this effect themselves, e.g. doing sport and sweating. When the sweat film evaporates on the skin, sensible heat, i.e. heat that you can feel, is taken away and the body temperature falls.

Highest heat recovery rates
Menerga has been applying this principle in highly efficient air-conditioning technology for over 30 years. The air temperature can be lowered by up to 12 K by means of conventional evaporative cooling, without any energy input for cooling. Physically, however, there are limits to evaporative cooling, which are related to the respective wet-bulb temperature. Pure adiabatic systems cannot achieve a lower supply air temperature than about 20 °C. In hot summer months, therefore, an additional compression refrigeration system with significantly higher energy and maintenance costs, was typically the only solution.

Even higher energy savings
Menerga has now managed to expand the capacity limits of adibiatic systems. For many applications, a separate compression refrigeration system is no longer needed!



Save energy and operating costs

From an economic standpoint as well, adiabatic systems pay off for the system owner. Low power consumption reduces operating costs. Furthermore, the elimination of the compression refrigeration system, means a reduction in maintenance and regular leakage tests (as required under F-Gas regulations). There is also official legislation to limit the quantity (phase-down) of FC on the market befor 2035, meaning that the new technology developments in adiabatic cooling pose no cost risk for the future.

The best choice

Adiabatic variants

All variants at a glance	**Supply air temperature**	**Outdoor air dehumidification**	**Extract of sensitive loads (heat)**	**Extract of latent loads (humidity)**

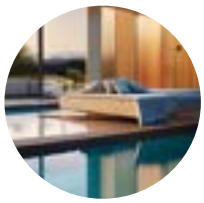
Area of Application: Swimming Pool

Public swimming pool

Indoor swimming pool air treatment and its special features

We offer solutions for private swimming pools, public swimming pools, adventure pools, sports pools, brine pools, hotel pools, school swimming pools, therapy pools and many more. Additionally: heat recovery from waste water.

Save energy costs: The costs of water, energy and maintenance for the operation of an indoor swimming pool are rising year by year. Any opportunity to make savings has to be used to keep entrance fees stable. The use of highly efficient technology reduces the energy demand significantly.



Sense of well-being: The room air temperature is usually 2-4 °C higher than the pool water temperature, but not higher than 34 °C. This small temperature difference is practically imperceptible to the user. The temperature and humidity in the pool hall contribute greatly to the well-being of the user. The absolute water content in the swimming hall plays an important role.

Protect the fabric of the building: Due to the constant evaporation of water from the pool surface, dehumidification of the indoor swimming pool air must be ensured around the clock, even in idle mode, in order to avoid damage to the building shell or other components.

Healthy air: The process of water treatment can lead to a concentration of disinfection by-products in the hall air. These can be removed from the swimming hall by a ventilation system in combination with a well-designed air distribution system.

Highest heat recovery rates
The air conditioning of swimming pool halls is one of the most demanding segments of air conditioning. This is where we started in 1980, this is where we grew up and this is where we are the market and innovation leader. Our special expertise: Highest heat recovery rates reduce operating costs, robust system designs survive the most adverse conditions.

Comfortable indoor climate
Modern indoor swimming pools offer guests much more than just an opportunity to swim. Fresh air increases the guests' sense of well-being. Around the pool, lounging areas invite guests to rest and relax. The associated long duration of the guest's stay, even outside the pool, increases the demands on the indoor swimming pool climate.
Due to the permanent evaporation of the pool water and in order to maintain the comfort criteria, indoor swimming pool dehumidification is required. Modern control systems ensure continuous adjustment of the swimming pool hall temperature and humidity and the amount of outside air required for dehumidification.

Protecting the building
In addition to the comfort requirements of the bathers, the protection of the building fabric is of enormous importance. A well thought-out air distribution system ensures that air is mixed in all areas of the swimming hall. This prevents the formation of moisture pockets and thus a possible fall below the dew point on building surfaces. Regardless of the intensity of use and the type of swimming pool hall, 24-hour operation of the air handling unit is always necessary. The selection of a highly efficient dehumidification unit is decisive for keeping the operating costs in a swimming pool hall low.

Our advisory process starts with a deep understanding of your requirements, challenges and goals. We listen attentively, carefully analyse your needs and then create customised solutions that are precisely tailored to your situation. We always place great emphasis on efficiency, sustainability and cost-effectiveness.

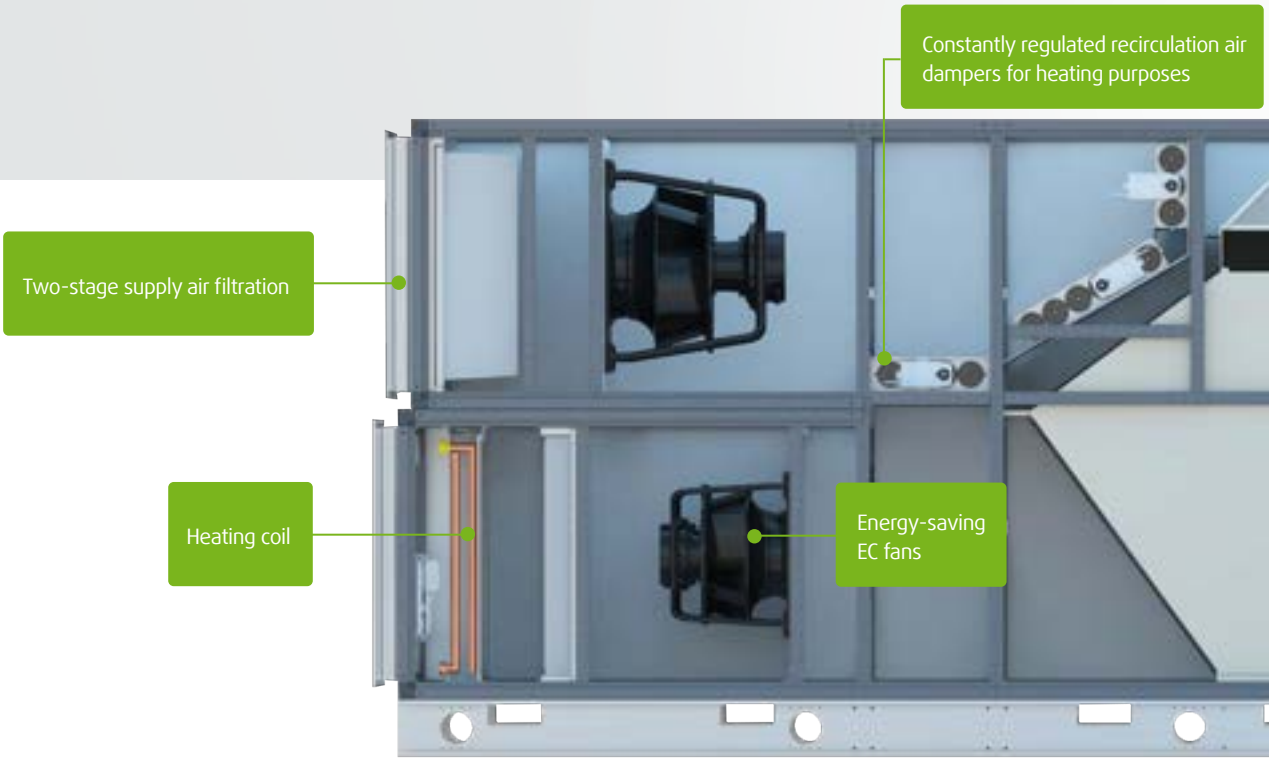
All-in-one concept: Air handling unit with counterflow plate heat exchanger

NX ThermoCond

Area of application: Public swimming pools, leisure pools, sports pools, brine pools, hotel pools, school swimming pools, therapy pools and many more.

Main functions: Complete unit - includes all components for heating, dehumidification and ventilation of swimming pools, including all switching and control elements.

Knowledge: This complete unit contains all components for ideal heating, dehumidification and ventilation of the swimming pool hall. The units of the NX ThermoCond series achieve a very high passive energy efficiency, as the integrated control and regulation Determines the minimum proportion of outdoor air that is required for dehumidifying the indoor swimming pool air. The integrated counterflow plate heat exchanger achieves the highest heat recovery rates with a real counterflow proportion of 80 %. Optionally, the units can be equipped with a fresh water heater for even more efficient use of the heat energy contained in the extract air.



Air volume flow:
2,730 - 37,000 m³/h

Additional details

Included performance parameters:

- → Corrosion-free counterflow plate heat exchanger made from polypropylene
- → Heating coil
- → Air filtration in all operating conditions, with filters in return, outside and supply air
- → Constantly regulated recirculation air dampers for heating purposes
- → Integrated freely programmable control and regulation unit
- → Intensive quality inspection with factory test run
- → Complete cleaning of the heat exchanger possible without dismantling

Additional options:

- → Recuperator in shortened design
- → Attenuator
- → Outdoor installation
- → Remote maintenance
- → Fresh water heater
- → Various BMS versions possible
- → Your contact person is available for further possible options

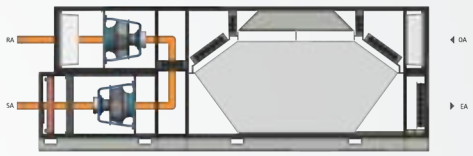
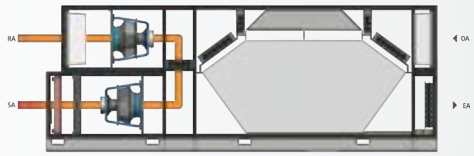
Functional description

Description

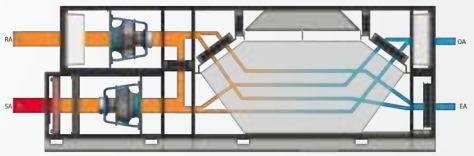
Standby mode:
No requirements for temperature and dehumidification, unit operates in pure recirculation mode. The aim is air circulation with reduced fan power.



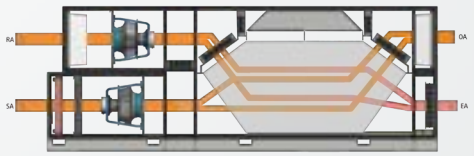
Recirculation mode Heating:
Heating as required via heating coil. The fresh air and exhaust air dampers are closed.



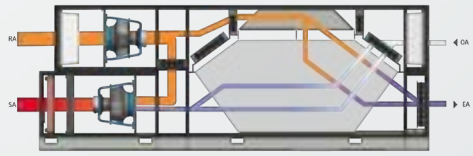
Dehumidification on the unit with counterflow heat exchanger:
Dehumidification of the indoor swimming pool air through demand-dependent mixing of outside air (minimum necessary outside air quantity during bathing operation according to VDI 2089 or local regulations) to the recirculation air volume flow. If necessary: Reheating of the supply air.



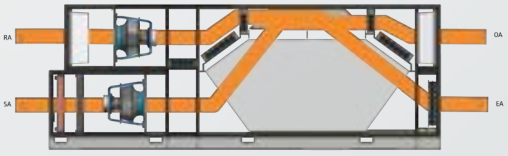
Fresh air / exhaust air mode:
As the outdoor air humidity rises, the recirculation damper is closed as required. When the outdoor humidity is high, the damper closes completely and the unit operates in outdoor air exhaust mode.



Defrost mode:
Recuperative heat exchangers tend to ice up at low outdoor air temperatures. This is prevented by opening the extract air/extract air bypass as required. The fresh air supply is not interrupted in the process.



Heat exchanger bypass:
The proportion of air routed via the heat exchanger and the bypass can be regulated up to free cooling.



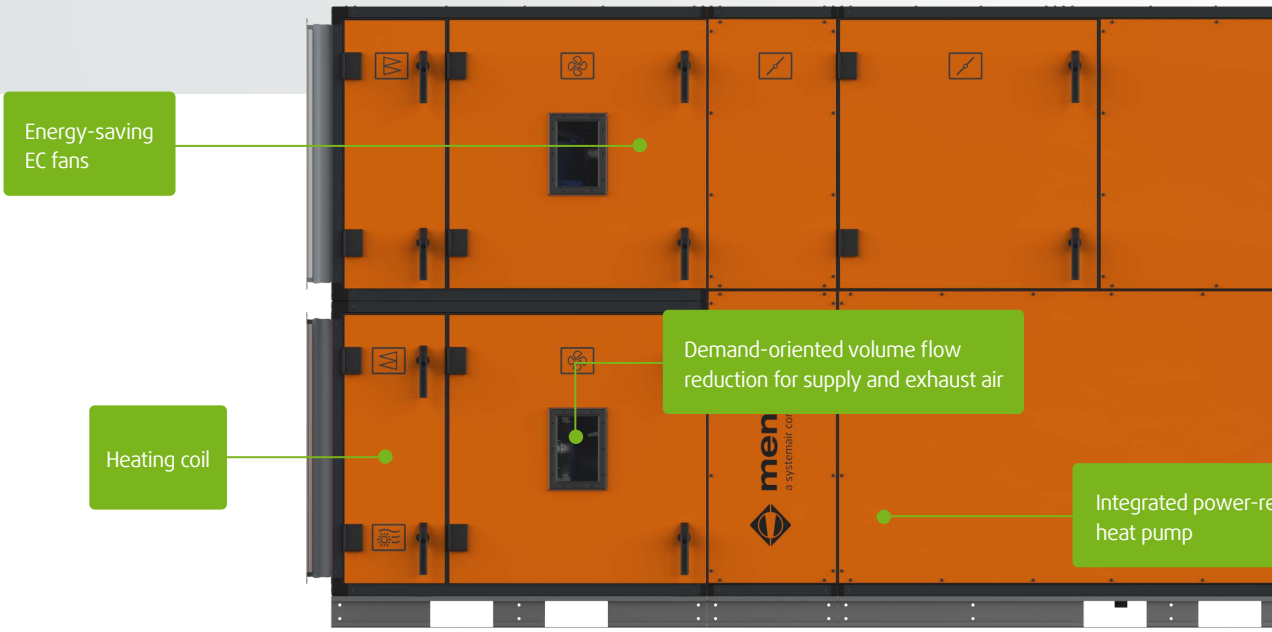
All-in-one concept: Air handling unit with heat exchanger and integrated capacity-controllable heat pump

NX ThermoCond HP
with heat pump

Area of application: public swimming pools, adventure pools, sports pools, brine pools, hotel pools, school swimming pools, therapy pools and many more

Main functions: Complete unit - includes all components for heating, dehumidification and ventilation of swimming pools, including all switching and control elements.

Knowledge: The NX ThermoCond HP achieves a very high energy efficiency, as the integrated control and regulation only mixes in the actual proportion of outdoor air that is needed to dehumidify the indoor swimming pool air. The overall efficiency of the system is additionally increased by the integrated output-controllable heat pump.



Air volume flow:
2,730 - 37,000 m³/h

Additional details

Included performance parameters:

- → Modular design with high variability
- → Filtering of the air in every operating mode
- → Heating coil
- → Individually adjustable performance parameters
- → Intensive quality inspection with factory test run

Additional options:

- → Pool water condenser
- → Heat recovery bypass function
- → Dehumidification in recirculation mode
- → Dehumidification of fresh air by means of additional fresh air and exhaust air outlets
- → Fresh water heater
- → Silencer
- → Outdoor installation
- → Remote maintenance

[3] According to EN 13053:2019

[4] According to VDI 2089

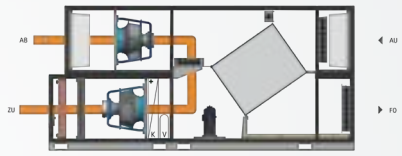
[5] Optional

Functional description

Description

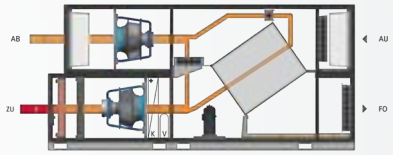
Stand-by mode

No requirement for temperature or dehumidification, device operates solely in recirculation mode. The aim is air circulation with reduced fan power.



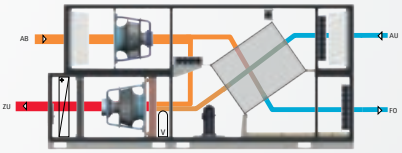
Recirc air heating operation

Heating in accordance with requirements for each heating coil. The outdoor air and exhaust air dampers are closed.



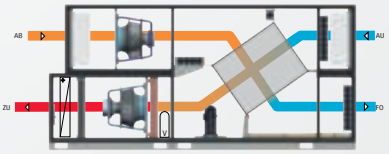
Dehumidification of the device with heat pump

The return air is cooled to below the dew point in the evaporator of the heat pump, reinforced by the recuperator. Outside air with a low moisture content is preheated in the heat exchanger, then mixed with an amount of untreated recirculation air, heated by the condenser and routed into the hall as supply air. If necessary, further heating is carried out with the help of heating coils. During swimming pool mode, the minimum required amount of outdoor air is added as needed.



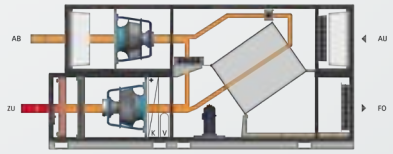
Outside air exhaust air mode

In the case of rising outdoor air humidity, the recirc air damper is closed as required. During high OA humidity, the damper closes completely, the device operates in outside air-exhaust air mode.



Defrost mode

Recuperative heat exchangers tend to ice up if the outdoor air temperatures are low. This is prevented by opening the return air-exhaust air bypass.



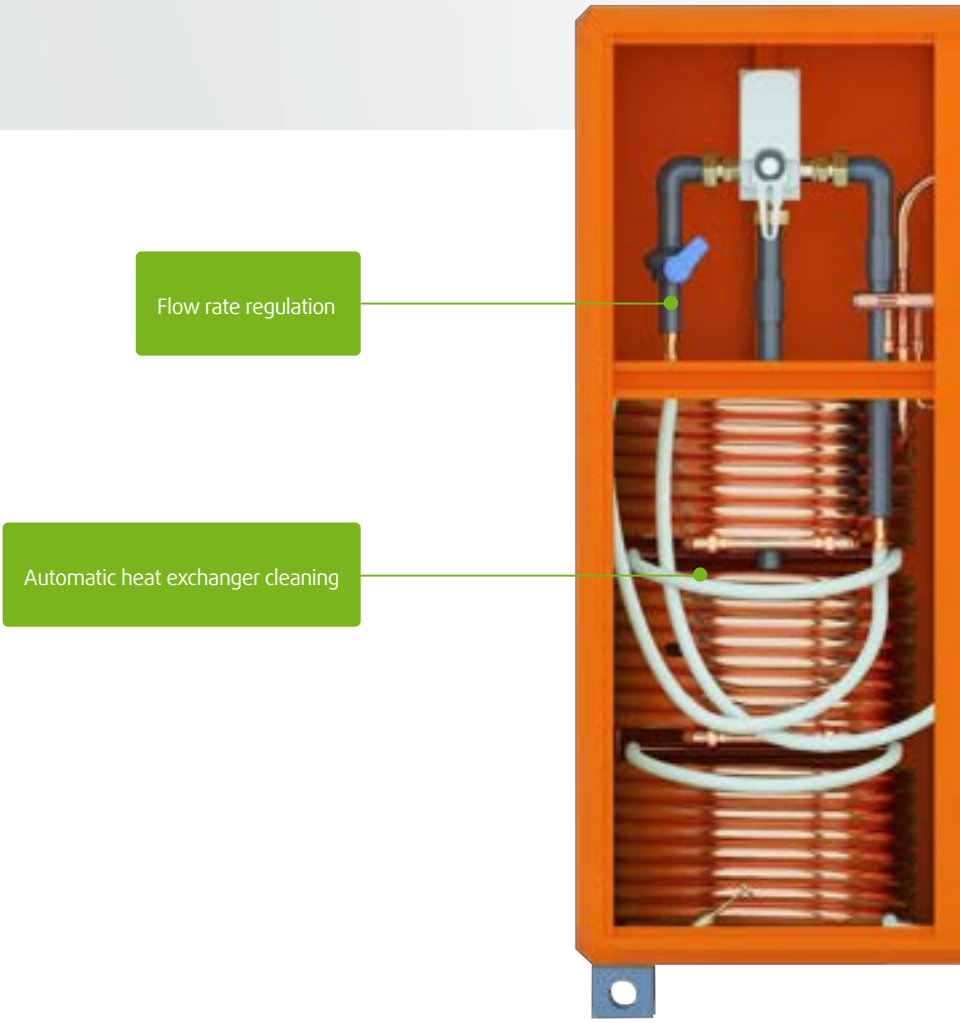
All in one concept: Heat recovery from waste water with counterflow coaxial recuperator and heat pump

AquaCond 44

Area of application: In the shower areas of swimming pool halls, hospitals or residential homes, in laundries as well as in many industrial processes.

Main functions: Complete unit - includes all components for heat recovery from waste water and efficient heating of fresh water.

Knowledge: All too often, warm wastewater is discharged unused into the sewage system along with the energy it contains. Units of the AquaCond 44 series recover a large part of this heat energy and transfer it to the fresh water. The combination of recuperator and heat pump requires only about 10 % of the energy that conventional heating would require. The heat exchanger cleaning integrated as standard allows the units to be used even with wastewater contaminated with dirt. Recover valuable energy - wherever warm wastewater is produced and warm fresh water has to be provided at the same time.



Quantity of flow:
1.2 – 5.4 m³/h

Additional details

Included performance parameters:

- → Automatic heat exchanger cleaning
- → Constant pipe cross-sections in the waste water path for constant flow velocity
- → Heat pump system with fully hermetic suction gas-cooled refrigerant compressor, on anti-vibration mounting
- → Complete unit ready for connection, contains all components for heat recovery from waste water, including all switching and control elements
- → Intensive quality inspection with factory test run

Additional options:

- → Design of the heat exchanger as a safety heat exchanger, for additional separation of fresh and waste water
- → Recuperator bypass
- → Version without heat pump
- → Also suitable for immersion pool cooling
- → And many more

Integrated control and regulation system, compatible with all conventional building management systems

Reduction of energy required to heat the fresh water by up to 90 %

Heat recovery from wastewater with counterflow coaxial recuperator and heat pump

AquaCond 44

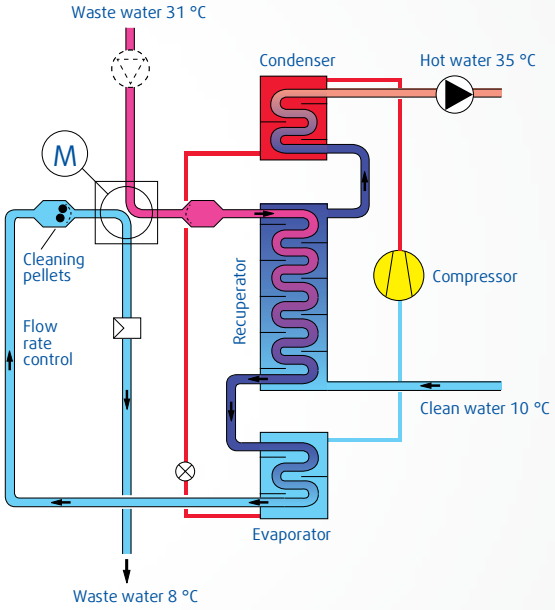
The function of an AquaCond unit is to heat cold fresh water to domestic water temperature in an energy-efficient manner. Energy from warm wastewater serves as the heat source. The heat is transferred by combining a recuperative heat exchanger with a heat pump.

In the first step, the warm waste water flows through the recuperator and then through the evaporator of the heat pump. In the opposite direction and in a separated path, the same amount of fresh water flows first through the recuperator and then through the condenser of the heat pump. In the recuperator, a large part of the heat contained in the waste water is transferred to the cold fresh water. This process takes place in an efficient countercurrent process and does not require any energy input. In the evaporator of the heat pump, a further part of the heat is extracted from the wastewater and transferred to the already preheated fresh water in the condenser of the heat pump. Due to the optimal coordination of the individual components, a total coefficient of performance of 11 is achieved.

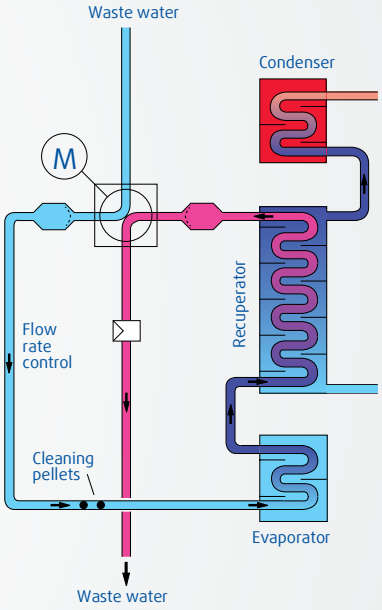
Constant pipe cross-sections in the waste water path guarantee uniformly high flow velocities. This reduces the build-up of dirt in the heat exchanger tubes and thus a deterioration of the heat exchanger efficiency by the very design. Despite the uniform flow, there is a possibility that soaps, greases

Functional description

Heat recovery phase



Cleaning phase



and other substances dissolved in the warm waste water will settle on the heat exchanger surfaces during the cooling phase.

If the waste water is organically contaminated, bacteria can grow and sludge can form on the surfaces of the heat exchangers. To prevent this, the automatic heat exchanger cleaning system feeds cleaning pellets through the waste water paths at regular intervals. The cleaning pellets loosen the deposits from the pipes and prevent the formation of dirt on the surfaces.

Area of application: Private and hotel swimming pools

Important facts

Private indoor swimming pool air treatment and its special features

Nowadays, your own indoor swimming pool often offers the comfort of a wellness oasis and a fitness facility in one. This makes a swimming hall a place of retreat to escape the stress of daily life. Especially in a private swimming hall, the main focus is on the feel-good factor.

Best air conditions for maximum relaxation
The air quality in the swimming pool hall determines the extent of relaxation in the swimming pool hall. Sultry, cold air or even draughts prevent a comfortable climate and quickly deprive the owners of the pleasure of swimming.

The building structure is protected
Particularly in a private swimming hall, the main focus is on the feel-good factor. A comfortable climate in the swimming pool hall plays a major role in this. Not only by the interaction between room temperature and humidity, but also the air circulation, which must be perfectly matched to the room conditions. This is because draughts or misted-up windows due to condensation must be avoided.

The ventilation system must ensure that the air circulates evenly in the swimming pool hall. This circulation is important for two reasons. On the one hand, the air transfers the heat to all components so that condensation on colder components is avoided.

Hygienic room air without unpleasant odours
On the other hand, a uniform movement of the air in the swimming pool hall ensures that the by-products released from the water during evaporation can be removed via the ventilation system. Due to the constant evaporation of water from the surface of the pool, the air in the indoor swimming pool must be dehumidified around the clock, even when the pool is not in use, in order to prevent damage to the building shell or other components.

High energy demand is minimised
To maintain a comfortable indoor swimming pool climate, indoor swimming pool units are used that enable dehumidification using outside air. Modern control systems in conjunction with a well-designed unit not only ensure a constant condition of the swimming pool hall, they also contribute to a comfortable and healthy climate with a sensibly controlled and demand-dependent outdoor air operation. A highly efficient heat recovery system reduces the energy requirement for dehumidifying the swimming pool hall to a minimum.

All in one concept: Air handling unit with cross-counterflow heat exchanger for private swimming pool halls

TX ThermoCond and TX ThermoCond HP with heat pump

Area of application: Private wellness area, home spa, small indoor swimming pool

Main functions: Complete unit - includes all components for heating, dehumidification and ventilation of the swimming pool hall.

Knowledge: The *TX ThermoCond* units dehumidify and heat the swimming pool hall, any pollutant concentration in the air is minimised. *TX ThermoCond* is suitable for swimming pools with lower heating requirements.

The *TX ThermoCond HP* is equipped with an integrated heat pump. This increases the overall efficiency of the system and enables the dehumidification of the indoor swimming pool air in recirculation mode. In addition, we are the only manufacturer to offer the option of coupling the system to a domestic heat pump, which heats the private swimming pool to a comfortable indoor climate.

Air volume flow:
740 - 3,310 m³/h

Additional details

Included performance parameters:

→ Filtering the air in all operating modes
→ Heating coil
→ Sound-optimised plastic impellers for even quieter operation
→ Bypass damper
→ Individually adjustable performance parameters
→ Intensive quality testing with factory test run

Additional options:

→ Air tracks water control option
→ Remote maintenance
→ Further versions possible

Additional options for the TX ThermoCond HP:

→ Pool water condenser
→ Domestic heat pump integration

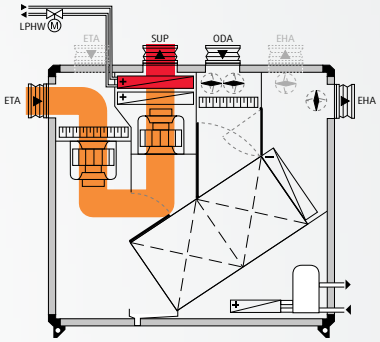
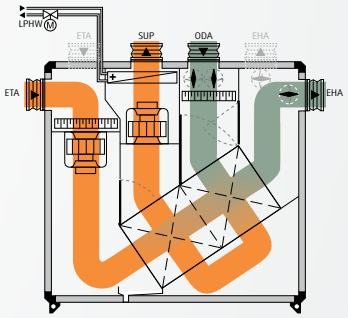
Functional description

Description

Recirculating air operation (heating):
If no requirements are placed on temperature regulation or dehumidification when the unit is in standby mode, the system operates only in recirculation mode with reduced air volume flow. The air circulation in the swimming pool hall is guaranteed. If heating is required, the return air is heated up using the heating coil to achieve the supply air temperature set-point.



Dehumidification using outside air in winter:
The swimming hall is dehumidified by adding outside air to the recirculation air volume flow. The proportion of outside air is automatically adjusted continuously depending on the current water evaporation (occupancy of the swimming pool hall) and the outside air humidity. If the heat recovery is not sufficient to achieve the supply air temperature, the supply air is reheated by the hot water heating coil.



Dehumidification using outside air in summer:
As the outside air humidity rises, the recirculation damper is closed as required. At high outdoor air humidity, the damper closes completely. The unit operates in 100 % fresh air/exhaust air mode via the heat exchanger.

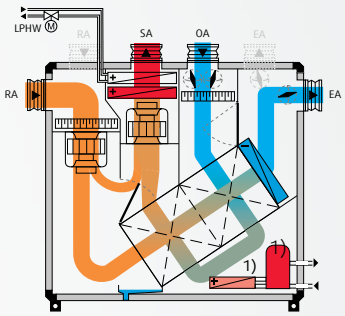
Functional description

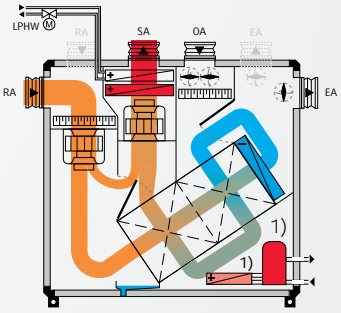
Description

Dehumidification using outside air in winter: A large proportion of the sensible and latent heat is recovered from the return air, and is transferred to the supply air via the cross-counterflow heat exchanger and evaporator. If the heat output of the heat pump is not sufficient, the supply air will be further heated using the heating coil. Excess heat can be transferred to the optional pool water condenser for heating the pool water.



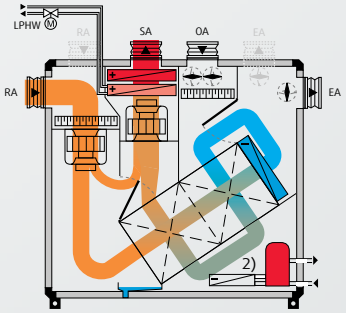
1) Option: pool water condenser

Recirculating air dehumidification:
The air is dehumidified in the evaporator of the heat pump; this process is intensified by the upstream connection of the heat exchanger. The already cooled and dried air is preheated in the heat exchanger by the swimming pool hall exhaust air. At the same time, the heat transfer on the other side of the heat exchanger causes the warm and humid swimming pool hall exhaust air to be cooled to near its dew point. The preheated, dehumidified air is then mixed with the proportion of untreated recirculated air, reheated at the condenser of the heat pump with the heat extracted during the dehumidification process and fed into the swimming hall as supply air. The heat pump is optimally designed with a dehumidification energy requirement of less than 0.25 kWh/kg. If required, the supply air is reheated by means of a hot-water heating coil.



1) Option: pool water condenser

Domestic heat pump operation:
An existing domestic heat pump can be used for energy-efficient heating of the swimming pool hall air. The domestic heat pump is connected to the heating coil. Typically, the low flow temperatures of the domestic heat pump are not sufficient for heating the swimming pool hall air – the heating coil is therefore installed upstream of the air condenser of the integrated heat pump. The domestic heat pump can so then be operated with an optimal COP without a change in the low flow temperatures. In combination, the two systems heat the supply air to the desired temperature level.



2) Option: domestic heat pump operation

All in one concept: Air handling unit with cross-counter-crossflow heat exchanger for private swimming pool halls

ThermoCond 23

Area of application: Private wellness area, home spa, small swimming hall

Main functions: Complete unit - includes all components for heating, dehumidification and ventilation of the swimming pool hall

Knowledge: Units in the series 23 dehumidify and heat the swimming pool hall and they reduce a possible concentration of harmful substances in the air. The units are multifunctional compact systems with integrated control and regulation. ThermoCond 23 achieves a very high heat recovery rate based on a special heat exchanger.

Air volume flow:
1,510 – 4,725 m³/h

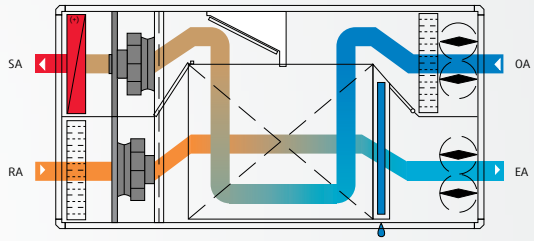
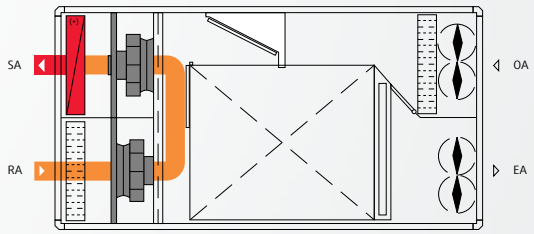
Functional description

Description

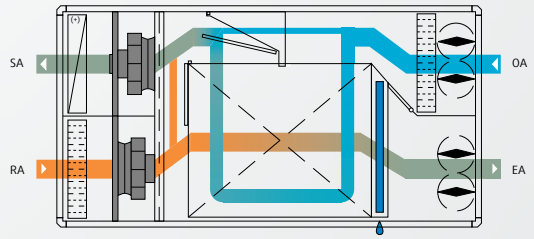
Dehumidification using outside air in winter:
A large proportion of the sensible and latent heat is recovered from the return air and is transferred to the supply air in the heat exchanger. The cross-counter-flow-cross heat exchanger enables the recovery of over to 90 % of the heat contained in the return air. The ventilation heat losses that have to be covered by the heating coil are thus kept to a minimum.



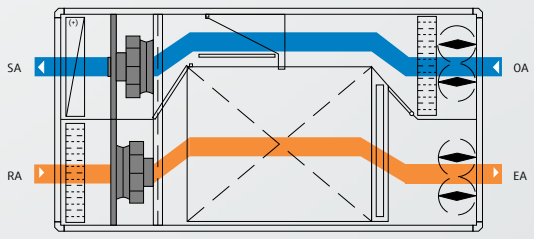
Recirculating air operation heating:
If no requirements are placed on temperature regulation or dehumidification when the unit is in standby mode, the system operates only in recirculating mode with reduced air volume flow. The air circulation in the swimming pool hall is guaranteed. If heating is required, the supply air is heated to meet the return air temperature required, using the heating coil.



Dehumidification in the transitional period:
When outside air temperatures rise, the output of the heating coil can be reduced. The heat recovered can be regulated by means of the controllable bypass damper. A proportion of the outside air can by-pass the plate heat exchanger.



Summertime conditions:
In the case of rising outside air humidity, the recirculation air damper is closing as required. When the outside air humidity is high, the damper closes completely.
The system works at 100 % outside air / exhaust air operation through the heat exchanger. Heat recovery is not required.



Area of Application: Aquaculture

Area of application: Aquaculture

Experience for 10 years:
We are the market and innovation leader in the field of indoor swimming pool ventilation. For 10 years we have been setting standards in the ventilation of land-based fish farms, so we know exactly what is important. Our systems ventilate, dehumidify and heat the rooms fully automatically, always at the most economical operating point.

Fish farms need to create precise and hygienic indoor climates for production halls, animals and staff. Humidity control is very important as bacteria can grow on damp surfaces.

Corrosion protection
In our units, the heat exchanger is made of polypropylene (PP) plastic. This material is highly resistant to many types of acids, alkalis, salts and solvents. Our heat exchanger is highly resistant to corrosion and ageing. It is insensitive to oxidation, rusting and other typical corrosion processes.

Energy efficiency
It is important to choose energy-efficient equipment and optimise operating times to minimise energy consumption. Our solutions can reduce both operating costs and environmental impact.

Safety
On the other hand, a uniform movement of the air in the swimming pool hall ensures that the by-products released from the water during evaporation can be removed via the ventilation system. Due to the constant evaporation of water from the surface of

Case studies

Shrimps farm

SwissShrimp AG, Germany

Special features of this project:
The production halls of the shrimp farm require conditions comparable to a public swimming pool. Room temperature of approx. 30 °C, water temperature in the production pools 28 °C as well as a room humidity of approx. 60 %. Furthermore, the rearing pools are managed with salt-enriched water, equivalent to seawater. This requires increased corrosion protection in the facilities. Air conditioning is provided by two outdoor units installed on the roof.

Two ThermoCond units, each with 25,000 m^3/h air volume.

the pool, the air in the indoor swimming pool must be dehumidified around the clock, even when the pool is not in use, in order to prevent damage to the building shell or other components.

Noise levels
Ventilation units can produce noise that can affect the well-being of the fish. Menerga's units can be equipped with an attenuator and therefore have a low noise level. This is an important point to minimise stress for the fish.

Sizing
Ventilation units should be sized according to the size of the fish farm and the number of fish kept. Calculation of the required ventilation capacity is done in consultation with our sales engineers.

Air Handling by Menerga

Building fabric is protected:
High humidity in the factory hall is avoided by our units.

Protection of employees:
Filtering of the air so that chemical components are filtered out and the respiratory tract of the employees is not burdened.

Lower maintenance:
The use of our polypropylene heat exchanger, provides extra corrosion protection, contributing to a longer service life. Polypropylene has a high resistance to many types of acids, alkalis, salts and solvents.

Salmon farm

Norway Royal Salmon, Dåfjord

Air dehumidification for Aquaculture:
In Norway Royal Salmon's production hall, we rely on a combination of 6 NX ThermoCond and 6 Drysolair units for ventilation and dehumidification. These state-of-the-art systems from Menerga not only ensure optimum air circulation, but also regulate the humidity in a controlled way. Thanks to the precise control, we create ideal conditions for the growth and well-being of the aquacultures.

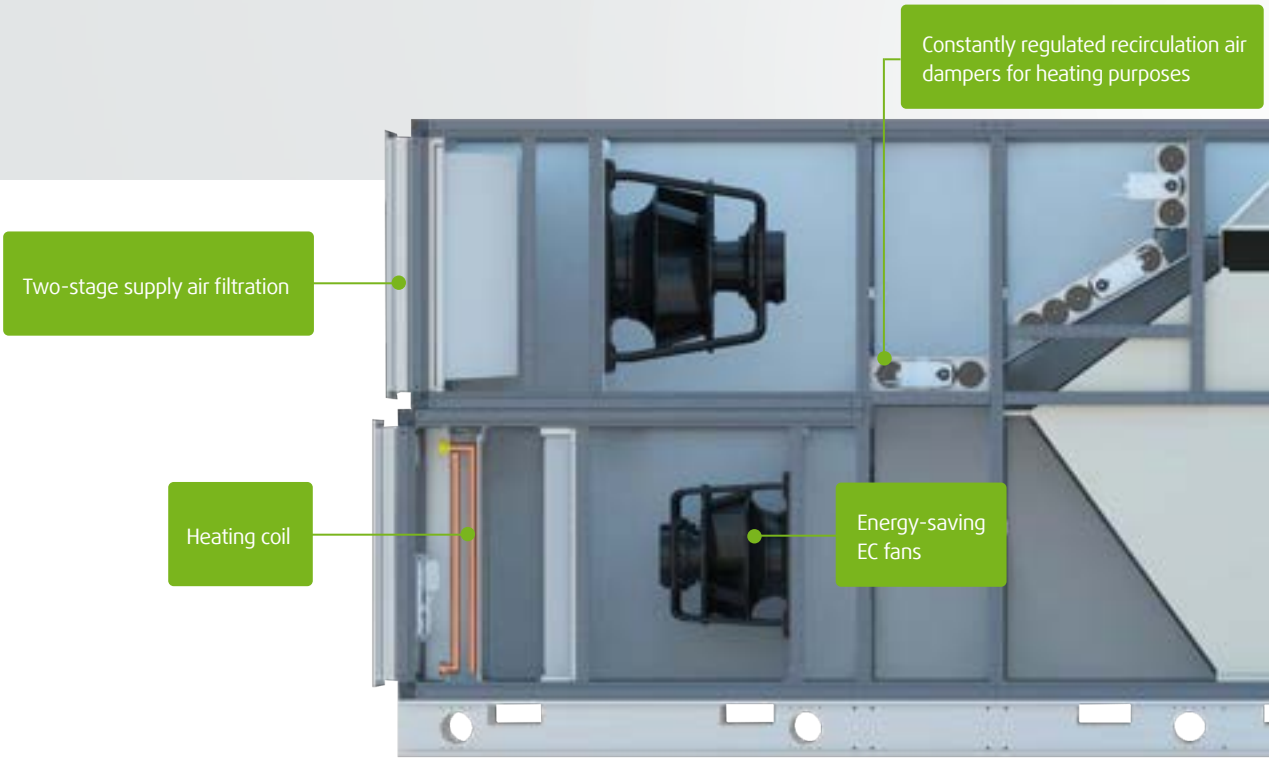
All-in-one concept: Air handling unit with counterflow plate heat exchanger

NX ThermoCond Aquaculture

Area of application: Aquaculture

Main functions: Complete unit - includes all components for heating, dehumidification and ventilation of aquaculture, including all switching and control elements.

Knowledge: This complete unit contains all components for ideal heating, dehumidification and ventilation of the Aquaculture building. The units of the NX ThermoCond series achieve a very high passive energy efficiency, as the integrated control and regulation Determines the minimum proportion of outdoor air that is required for dehumidifying the indoor industry hall air. The integrated counterflow plate heat exchanger achieves the highest heat recovery rates with a real counterflow proportion of 80 %. Optionally, the units can be equipped with a fresh water heater for even more efficient use of the heat energy contained in the extract air.



Air volume flow:
2,730 - 37,000 m³/h

Additional details

Included performance parameters:

- → Corrosion-free counterflow plate heat exchanger made from polypropylene
- → Heating coil
- → Air filtration in all operating conditions, with filters in return, outside and supply air
- → Constantly regulated recirculation air dampers for heating purposes
- → Integrated freely programmable control and regulation unit
- → Intensive quality inspection with factory test run
- → Complete cleaning of the heat exchanger possible without dismantling

Additional options:

- → Recuperator in shortened design
- → Attenuator
- → Outdoor installation
- → Remote maintenance
- → Fresh water heater
- → Various BMS versions possible
- → Your contact person is available for further possible options

[1] At air velocity 1.8 m/s
[2] Depending on unit equipment and installation height
[3] At OA = -12 °C / 90 % r.h.; EA = 30 °C/53.7 % r.h.
[4] Upper volume flow rate limit for compliance with EU Regulation 1253/2014
[5] Optional equipment
All air volume flows are based on standard density 1.2 kg/m^3 at OA = 15 °C/85 % r.h.; EA = 30 °C/53.7 % r.h., unless otherwise stated.

Functional description

Description	
Standby mode: No requirements for temperature and dehumidification, unit operates in pure recirculation mode. The aim is air circulation with reduced fan power.	Recirculation mode Heating: Heating as required via heating coil. The fresh air and exhaust air dampers are closed.	Dehumidification on the unit with counterflow heat exchanger: Dehumidification of the indoor swimming pool air through demand-dependent mixing of outside air (minimum necessary outside air quantity during bathing operation according to VDI 2089 or local regulations) to the recirculation air volume flow. If necessary: Reheating of the supply air.	Fresh air / exhaust air mode: As the outdoor air humidity rises, the recirculation damper is closed as required. When the outdoor humidity is high, the damper closes completely and the unit operates in outdoor air exhaust mode.	Defrost mode: Recuperative heat exchangers tend to ice up at low outdoor air temperatures. This is prevented by opening the extract air/extract air bypass as required. The fresh air supply is not interrupted in the process.	Heat exchanger bypass: The proportion of air routed via the heat exchanger and the bypass can be regulated up to free cooling.	
All-in-one concept: Air handling unit with double plate heat exchanger and adiabatic evaporative cooling

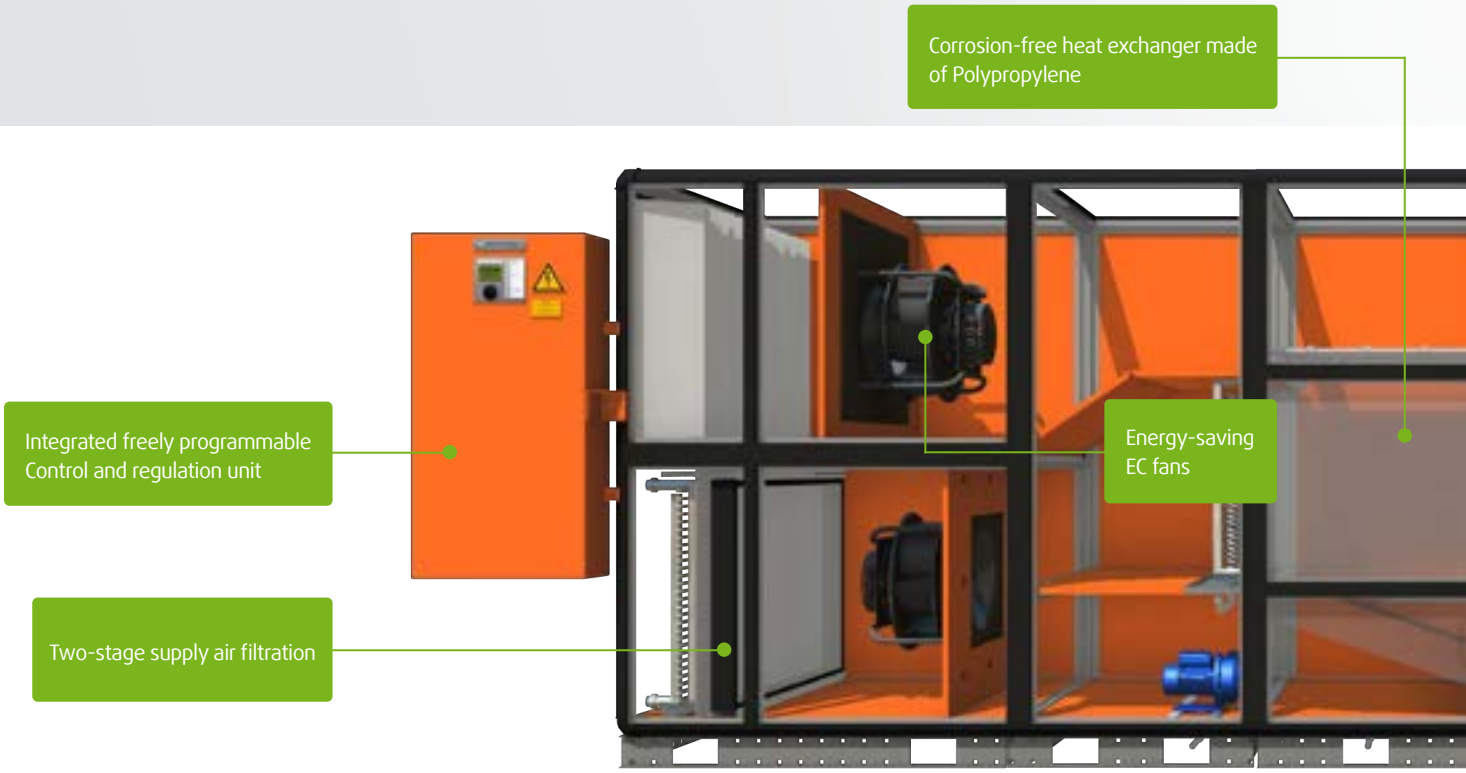
NX Adsolair

Area of application: Surrounding industrial areas of the aquaculture, e.g. production halls, storage rooms, cold storage rooms and offices

Main functions: Complete unit ready for connection, contains all components for low energy ventilation, including all switching and control elements.

Knowledge: Requirements with high thermal loads can be ideally met with the different cooling options of the units in series Adsolair. The unit uses adiabatic evaporative cooling an achieves to cool up to 12 K (at OA = 34 °C / 40 % r.h.) with water. At series 58 the total cooling capacity is further enhanced with an integrated compression refrigeration system.

Air volume flow:
2,200 – 40,800 m³/h



Additional details

Included performance parameters:

- → Filtering of the air in every operating mode
- → Corrosion-free heat exchanger made of Polypropylene
- → Pump hot water heating coil
- → Thermal bridge factor TB1
- → Individually adjustable performance parameters
- → Intensive quality testing with factory test run

Additional options:

- → Automatic heat exchanger cleaning system
- → Pump cold water cooling coil (Series 56)
- → Pressure reversal
- → Attenuator
- → Reversible refrigeration system (Series 58)
- → Outdoor installation
- → Hot water extraction to use the waste heat for heating purposes (Series 58)
- → Increase in cooling capacity
- → Remote maintenance
- → Larger air volumes on request
- → And many more

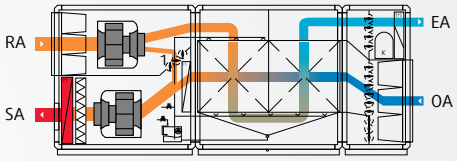
[1] Dependent on configuration of measurement and control system/unit

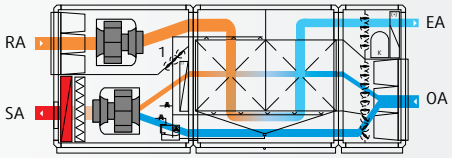
Functional description

Description

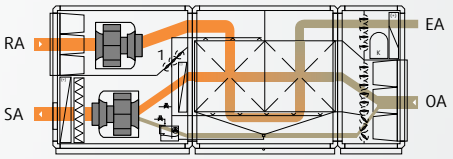
Wintertime conditions: In case of low outside temperatures the system operates in full heat recovery mode. The standard heating coil (LPHW) compensates for ventilation and transmission heat losses of the building as required.



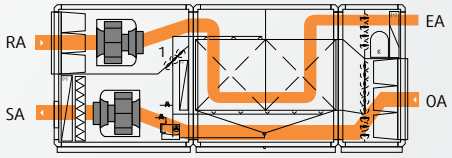
Defrosting circuit: All recuperative heat exchangers tend to ice over in the exhaust air section with low outside temperatures. In defrost operation, the OA-SA bypass opens, reducing the outside air flow rate going through the recuperator. The heat contained in the return air melts any ice in the heat exchanger, while the airflow rate routed through the recuperator is regulated as required.



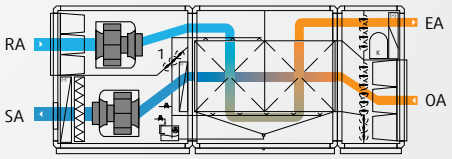
Transitional period: As the outside air temperature rises, the heat recovery demand is reduced. The OA/SA bypass damper, which runs the entire depth of the unit, is continuously regulated in order to achieve the desired supply airtemperature.



Free cooling: If the outside temperature continue to rises, the heat recovery is bypassed. The structural design of the OA/SA bypass ensures that the pressure losses within the unit are low and that the power consumption of both fans in bypass mode is also low.



Summertime conditions: If the outside temperature rises above the return temperature, the highly efficient heat exchanger is used as a „cooling recovery system". The warm outside air is cooled by the return air.



Indirect adiabatic evaporative cooling: The Menerga Adsolair principle uses the advantages of indirect adiabatic evaporative cooling without the disadvantages of supply air humidification. A major component of the Adsolair principle is the double plate heat exchanger, in which the return air is adiabatically cooled. In return, the outside air is cooled by the humid, cold exhaust air, without being humidified. The high efficiency rate lies in the fact that both processes (adiabatic evaporative cooling of the return air + cooling of the outside air) take place simultaneously in the heat exchanger. The high degree of temperature efficiency of the double plate heat exchanger allows significant cooling of the OA-SA by over 12 K (at OA = 34 °C / 40 % r.h.). If required, the compressor refrigeration system will switch on and cool the supply air even further.

***SwissShrimp AG** - Sustainable shrimp farm, Rheinfelden*

All in one concept: Air dehumidification unit with cross counterflow plate heat exchanger and heat pump

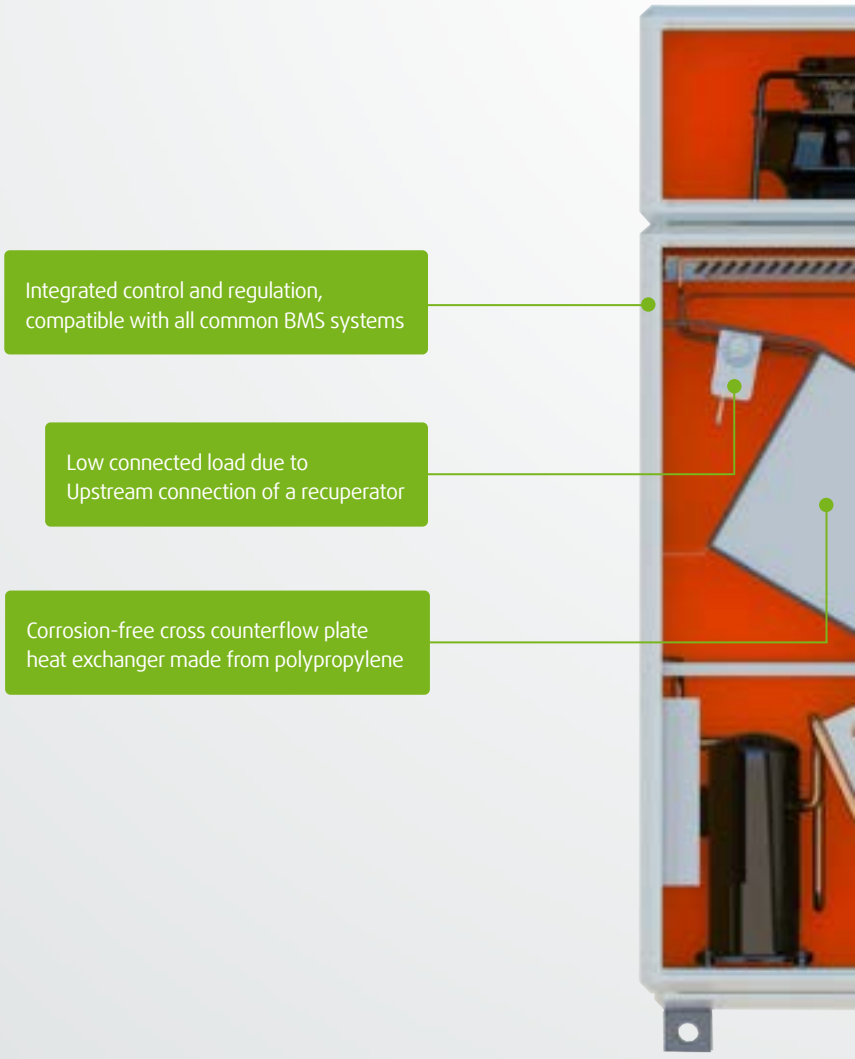
Drysolair 11

Area of application: Food production, Aquaculture

Main functions: Complete unit ready for connection, includes all components for air dehumidification for all drying applications with cross-flow plate heat exchanger and heat pump.

Knowledge: Units in the Drysolair 11 series were developed especially for discharging high levels of internal moisture to the atmosphere. Through the pre-cooling in the recuperator of the air to be dried, the unit works with considerably lower compressor performance than a simple heat pump system and creates a consistently good climate in ice rinks, the drying of buildings or industrial drying processes. The combination of first-class components with precise control and regulation guarantees economical operation at all times and adjusts the temperature and humidity as required.

Air volume flow:
1,000 – 6,000 m³/h



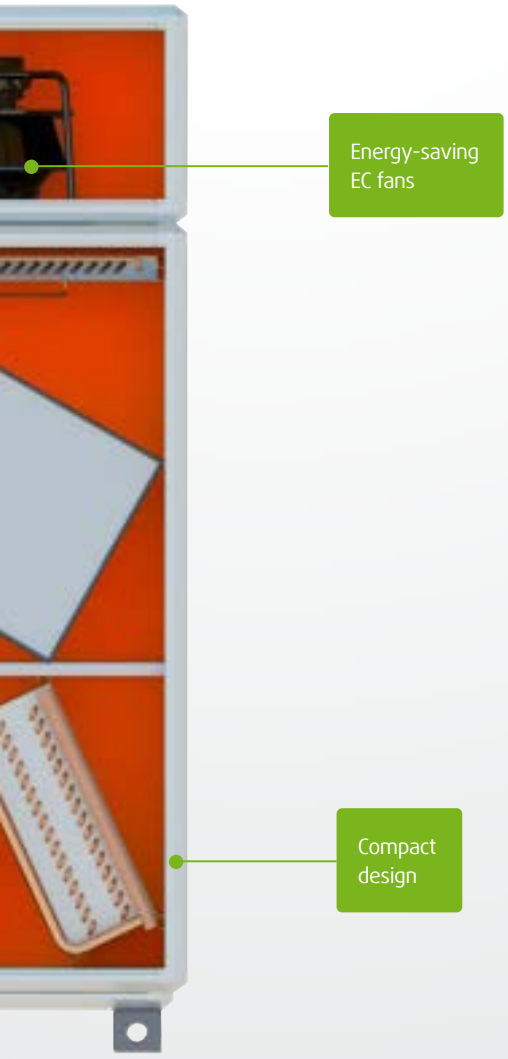
Additional details

Included performance parameters:

- → Specific power consumption of less than 500 Wh/kg dehumidification capacity
- → Air filtration
- → Corrosion-free heat exchanger made of polypropylene
- → Individually adjustable performance parameters
- → Complete unit ready for connection, contains all components for industrial air-conditioning, including all switching and control elements.
- → Intensive quality testing with factory test run

Additional options:

- → Room humidity control
- → Hot water condenser
- → Remote maintenance
- → And many more



All in one concept: Air dehumidification unit with cross counterflow plate heat exchanger and heat pump

Functional description

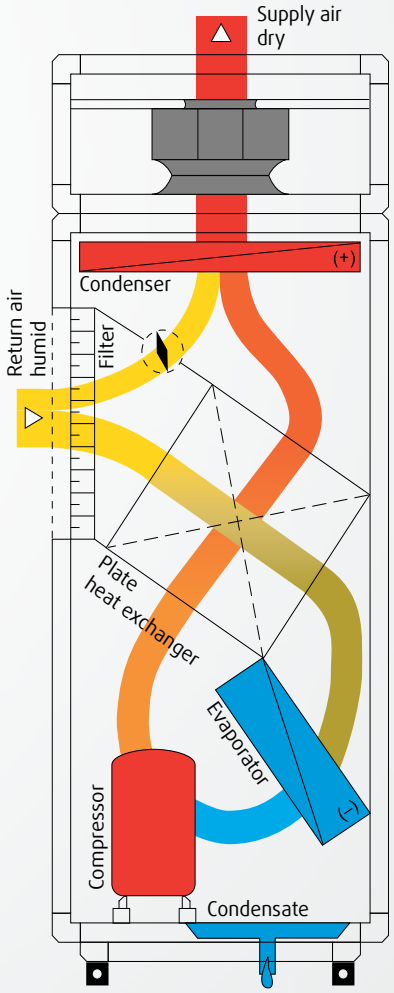
In recirculation mode humid air is dehumidified in two stages and supplied into the room as dry supply air. The return air is pre-cooled and dehumidified in the plate heat exchanger.

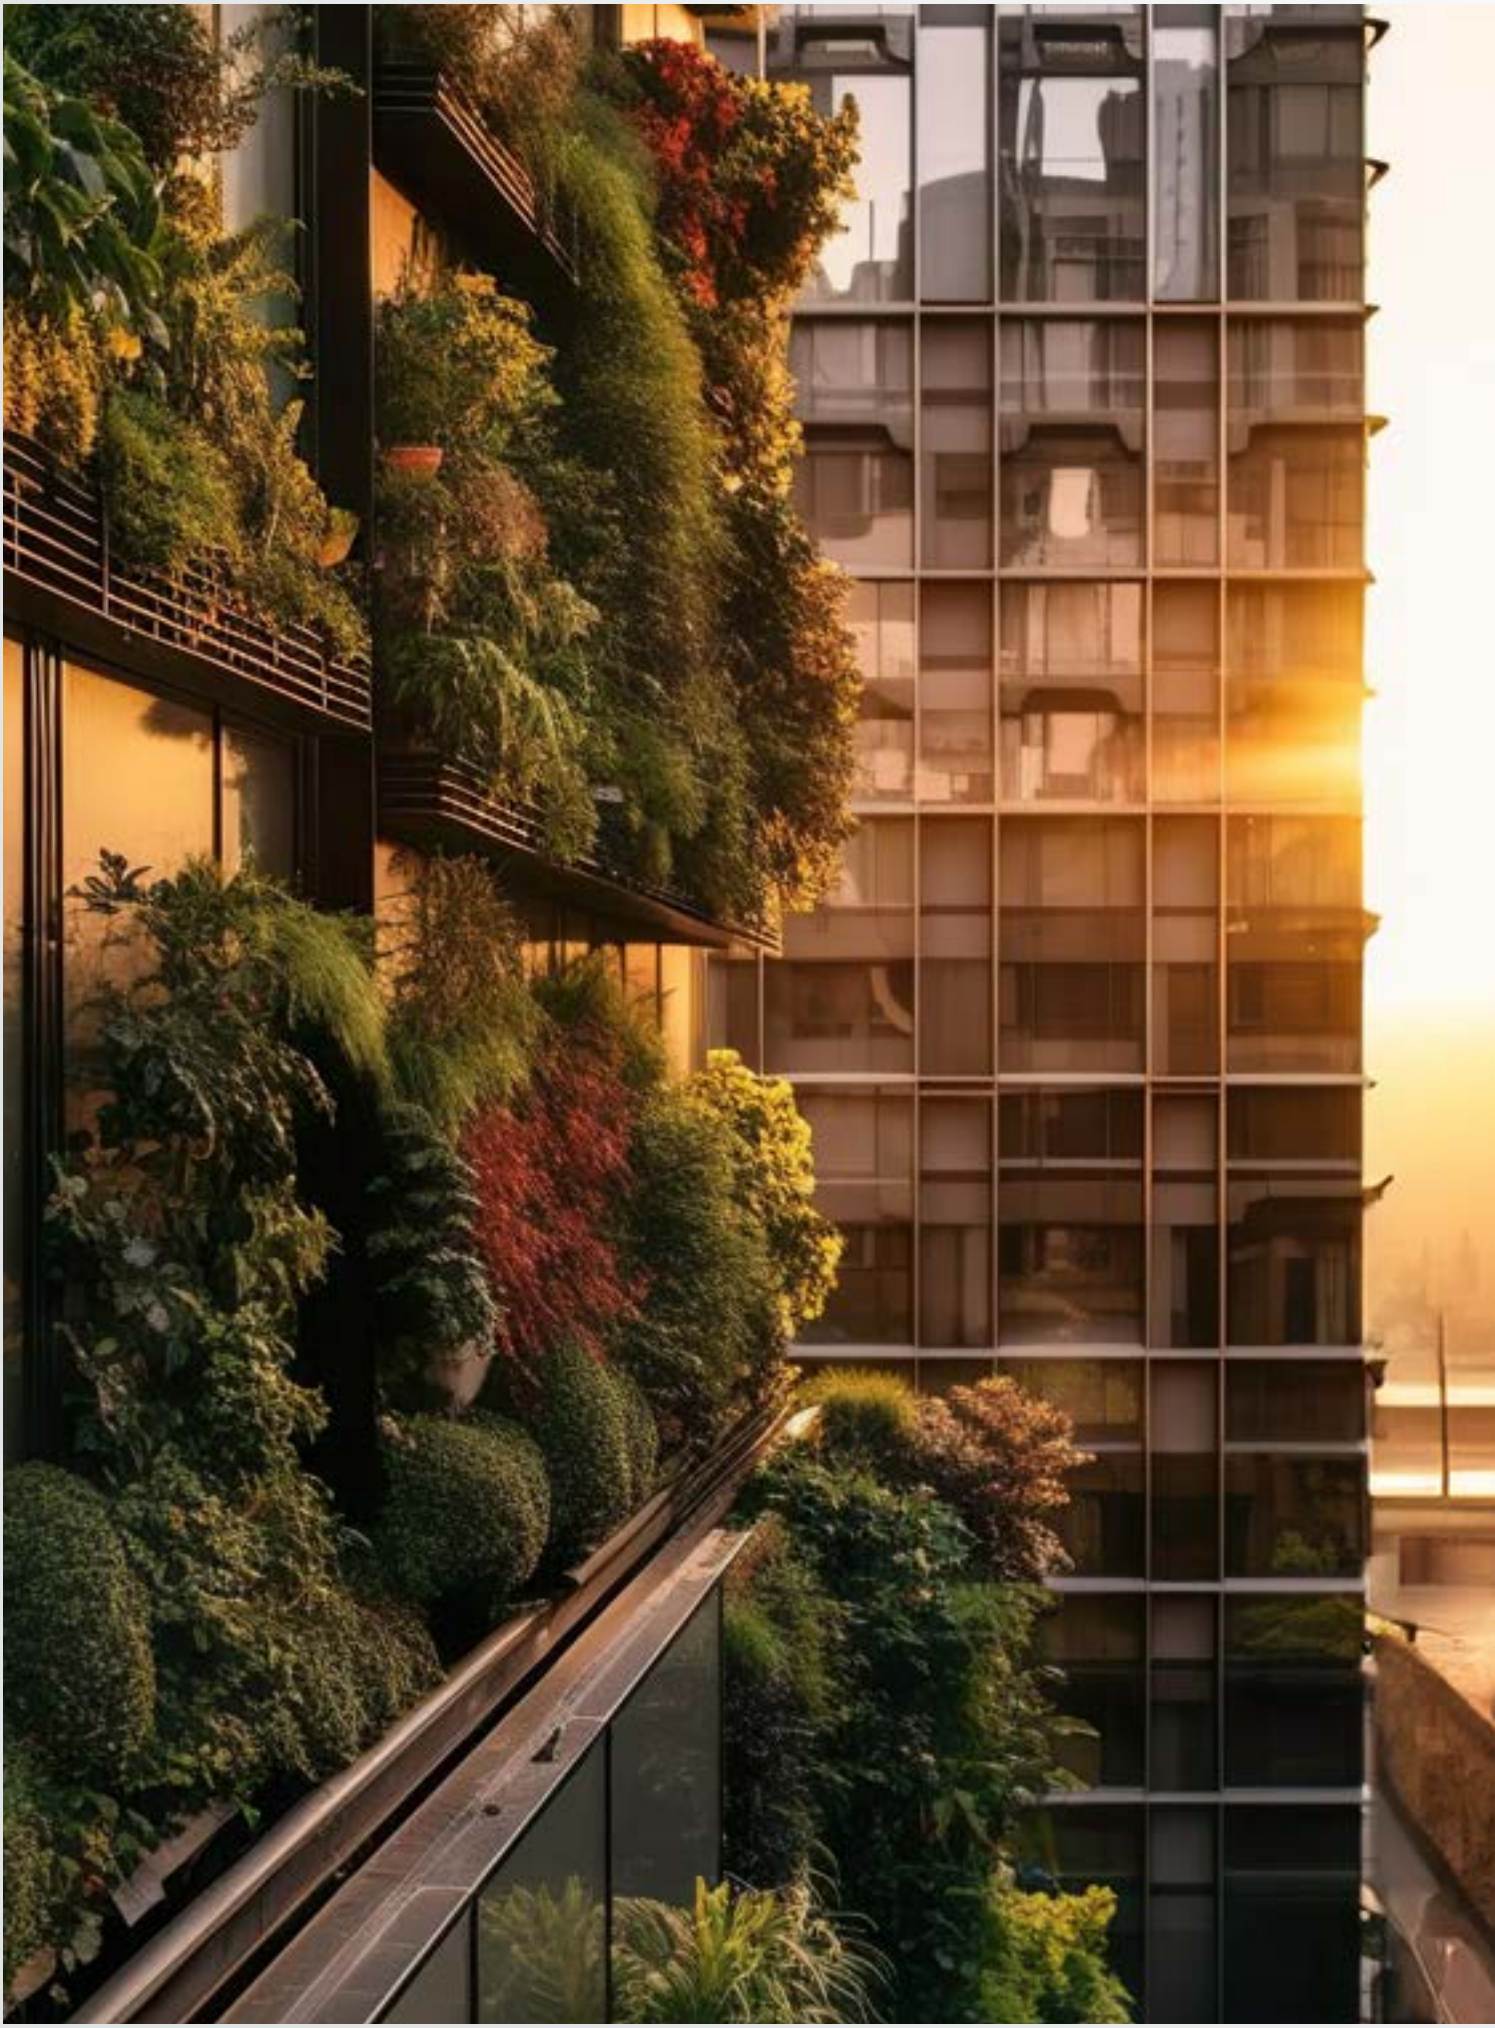
Climate solution from Menerga

The dehumidification to the desired supply air humidity level takes place by means of cooling the air to below its dew point in the evaporator of the heat pump. The air that has been dried in this manner is then warmed back up again in the condenser of the heat pump using its own heat, which was removed during cooling, and is brought to the required condition. The pre-cooling in the plate heat exchanger of the air to be dried means that the air dehumidification unit operates with a considerably lower compressor performance and hence a significantly lower energy consumption than a simple heat pump solution. The integrated bypass allows fast and precise control and adjustment to the condition of the return air. The cooling capacity is thus continuously adapted to the respective requirements.

Specific dehumidification energy requirement

Drysolair achieves a specific dehumidification energy requirement of far less than 500 Wh/kg. With one kilowatt hour of electrical energy, it is therefore possible to remove more than 2 kg of humidity from the recirculation air. In contrast, classical solutions without integrated heat recovery systems reach peak values in excess of 1,000 Wh/kg.





Area of Application: Net-Zero Energy Buildings (NZEB)

Net-zero energy buildings (NZEB)

Innovative ventilation solution pioneers net-zero energy buildings

The concept of net zero energy buildings has gained popularity as a sign of progress in sustainability and energy efficiency. These buildings represent a rethinking of architecture and engineering, as they generate as much energy as they consume. Menerga leads this movement with a pioneering ventilation solution for net-zero energy buildings. Through the clever integration of cutting-edge technology and a deep-rooted commitment to the environment, Menerga is redefining how net-zero energy building structures are ventilated and their interiors optimised.

Office
Excess heat is often generated in offices due to the presence of a large number of people and the use of technical equipment, such as computers, copiers, and lighting. The role of air conditioning in offices is primarily focused on cooling and dehumidification during the summer months, as well as ensuring a constant air exchange. It is important to maintain a constant room temperature and humidity level.

Education
It is particularly important in settings such as schools, universities, and kindergartens to ensure a continuous supply of fresh air through ventilation and air conditioning in accordance with demand. If feasible, this should be based on regulation controlled by CO2. As the concentration of CO2 increases in the air, people are more likely to experience fatigue, headaches, and lack of concentration. Demand-controlled air conditioning significantly reduces energy costs since the rooms are used only for limited periods during the day.

Sustainable air handling for net-zero energy buildings (NZEBs):
Im globalen Streben nach nachhaltigen und energieeffizienten Gebäuden gewinnen Netto-Null-Energie-Gebäude (NZEB) zunehmend an Bedeutung, da sie Energieproduktion und -verbrauch in Einklang bringen. In diesem progressiven Umfeld nimmt Menerga eine Spitzenposition ein und bietet hochmoderne Lösungen im Bereich der Klima- und Lüftungstechnik an, die sich mit den strengen Vorschriften und Anforderungen für NZEB decken.

Menerga's innovative solutions in focus:
The current regulations affecting NZEB in the field of air conditioning and ventilation play a crucial role in ensuring the smooth operation and optimal performance of these pioneering structures. Menerga recognises the importance of these regulations and uses its commitment to environmentally friendly technologies and innovative approaches to meet the requirements of modern legislation.

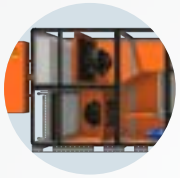
A key element of the NZEB regulations is the need for efficient climate control and ventilation, which aims to minimise energy consumption while creating a comfortable and healthy indoor environment for occupants. Menerga has responded by developing bespoke climate control and ventilation solutions specifically designed to meet the unique requirements of NZEB.

In summary:
Our solutions are designed to maximise energy efficiency and promote the use of renewable energy sources, while providing maximum comfort and excellent indoor air quality.

Cultural institutions
Optimal regulation of temperature and humidity on the exhibit surfaces and within the room itself prevents the destruction or premature aging of the exhibits. A good air conditioning system also automatically adjusts to changes in the number of visitors to maintain the desired air quality at all times.

Many more
If you're looking for reliable, efficient and sustainable solutions for your project, you've come to the right place. Contact us today to find out more about our products and services and how we can help you transform your building into an energy efficient and environmentally friendly showpiece. Together we can build a sustainable future.

Unit overview



NZEB		NX Adconair	NX Adsolair
Office	A healthy indoor climate with a continuous supply of fresh air increases employee productivity.	+++	++
Museum	Different exhibits place the most varied demands on the necessary air conditions.	+++	++
Theatre	High air volumes, high comfort, but without noticing it. Here, the ventilation technology is often completely hidden.	+++	+++
Laboratory	Laboratories not only require the highest precision in supply air quality, but often also special protection for the unit.	+	+++
Nursing homes	The feel-good climate must be ensured all year round for residents, guests and staff alike.	+++	++
Art galleries	Adherence to narrow tolerances places the highest demands on the equipment.	+++	++
Education	Central ventilation systems provide hygienic air exchange all year round without disturbing equipment in the classroom.	+++	++
Passive House	Building with the very highest energy efficiency as a goal - with certified units up to 15,000 m^3/h.	+++	
Commercial kitchens	The greasy exhaust air requires special protection of the units. Exclusively with us, there is a matching self-cleaning system for heat recovery.	+	+++
Archives	Precision climates with tight tolerances make high-performance measurement and control system technology indispensable.	+	++
Ventilation with polluted exhaust air	Whether it's a laboratory or an industrial hall, high-tech equipment such as the self-cleaning function or plastic lining are in demand.	+	+++

Products at a glance
To help you understand the application range of our products at a glance, we have created an evaluation table to help you make the right choice for your individual requirements.

This evaluation table is designed to help you select the right ventilation solution for your specific requirements. If you have any questions or are unsure, our experts will be happy to help you with your decision.

Menerga rating system
Good: This rating indicates that our air handling units perform solidly in this application area. They meet basic requirements and are a reliable choice for normal applications.

Excellent: Air handling units with this rating exceed the standards and offer above-average performance in this area. They are ideal for situations where improved efficiency and performance is required.

Best in Class: Our air handling units with this rating represent the ultimate in this application area. They offer outstanding performance, innovative technology and maximum efficiency. If you are looking for the best of the best, these are the solutions to meet your needs.

All in one concept: Air handling unit with cross-counterflow-cross heat exchanger

Trisolair

Application area: Office, museum, theatre, nursing homes, art galleries, educations, technical rooms, ancillary rooms, changing rooms

Main functions: Complete unit ready for connection, includes all components for low energy ventilation, including all switching and control elements.

Knowledge: Trisolair 52 and 59 series combine the highest heat recovery efficiency, low pressure drops and compact design. Ideal application areas are refurbishments at low to medium air volumes. A compressor refrigeration system integrated into the 59 series increases the cooling capacity of the overall system at high temperatures and additionally allows dehumidification of the outside air.

Air volume flow:
1,180 – 4,900 m³/h

Additional details

Included performance parameters:

→ Filtering the air in all operating modes
→ Corrosion-free heat exchanger made from polypropylene
→ Heating coil
→ Bypass damper
→ Individually controllable performance parameters
→ Intensive quality inspection with factory test run

Additional options:

→ Recirculation air dampers for heating purposes
→ Cooling coil
→ Remote maintenance
→ And many more

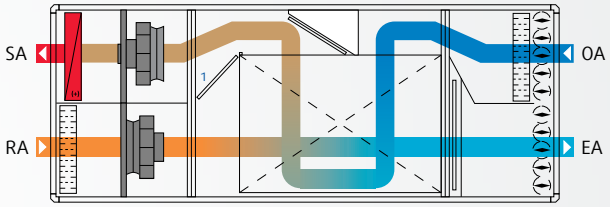
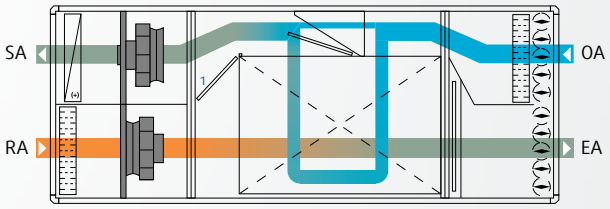
Functional description

Description

Heat recovery: In case of low outside temperatures the system operates completely in heat recovery mode. The cross-counterflow-cross plate heat exchanger enables the recovery of up to 80 % of the heat contained in the return air. The standard integrated heating coil compensates for ventilation and transmission heat losses of the building as required.



Reduced heat recovery: If the outside air temperature rises, the heat recovery requirement is reduced. The bypass dampers, which run along the entire depth of the unit, are continuously regulated in order to achieve the desired supply air temperature. If the outside temperature continues to rise, the heat recovery is completely bypassed. The design of the bypass reduces the internal pressure drop on the OA-SA path and hence also significantly reduces the power consumption of the fan motor.



Summertime conditions: If the outside temperature rises above the return temperature, the highly efficient heat exchanger is used as a "cooling recovery system". The warm outside air is cooled by the return air.

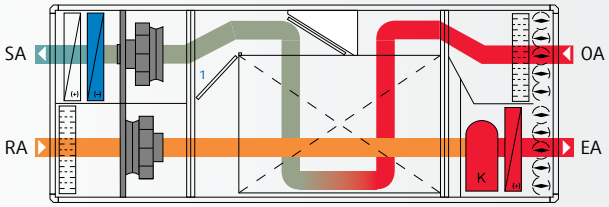
Functional description

Description in addition to the Trisolair

Cooling operation type 59:

Where outside air temperatures are sufficiently high, the heat exchanger is used for precooling the outside air (cold recovery). This minimises the electrical capacity required by the integrated compressor refrigeration system, which cools the supply air to the desired temperature and dehumidifies it if required. If unfavourable temperature conditions mean that precooling is not practical, the heat exchanger is bypassed.



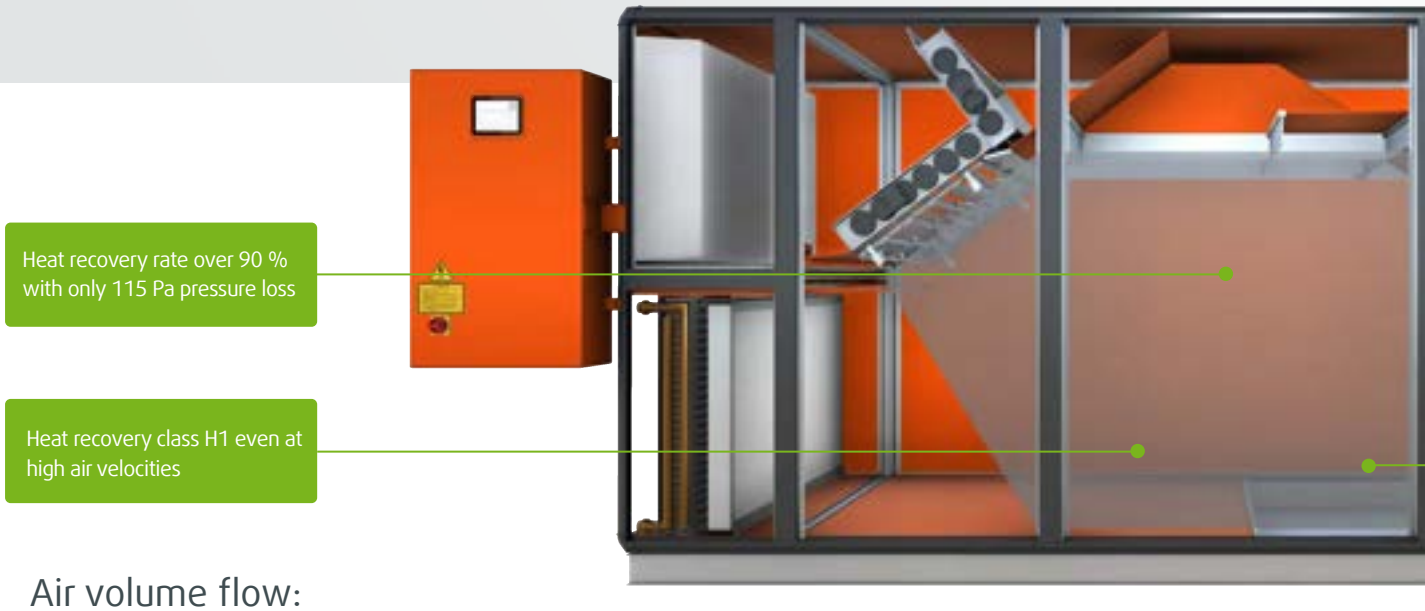
All-in-one concept: Air handling unit with counterflow plate heat exchanger

NX Adconair

Area of application: Production facilities, food industry, canteens, exhibition halls, commercial kitchen

Main functions: Complete unit ready for connection, which contains all components for low energy ventilation, including all switching and control elements. With the counterflow plate heat exchanger, NX Adconair sets the highest standards in terms of energy efficiency.

Knowledge: NX Adconair sets the highest standards with the counterflow plate heat exchanger. The heat exchanger works with a real counterflow proportion of more than 80 % with only 115 Pa pressure loss and at the same time achieves the highest energy efficiency classes. Menerga solutions with an NX Adconair are versatile and can therefore be used in a wide range of applications. Its unique design currently makes it one of the best plate heat exchangers available on the market. The polypropylene material used also allows only pure water to be used for the operation of the adiabatic cooling without the addition of additives, such as cleaning or wetting agents, and thus does not pollute the waste water.



Air volume flow:
2,730 – 36,900 m³/h

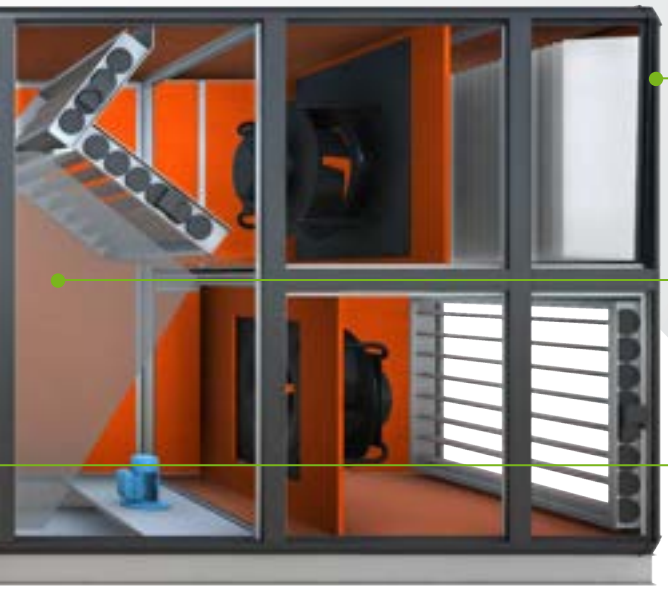
Additional details

Included performance parameters:

- → Corrosion-free counterflow plate heat exchanger made of polypropylene
- → EC fan motors / Menerga EcoWall
- → Heating coil
- → Integrated heat recovery bypass for free cooling
- → Integrated freely programmable control and control unit
- → Freely configurable air handling unit
- → Complete unit delivered ready for connection
- → Intensive quality inspection with factory test run
- → Complete cleaning of the heat exchanger possible without dismantling

Additional options:

- → Hybrid adiabatic
- → Thermally driven adsorption process for chilled water generation
- → Type-tested (PED 2014/68/EU) compression refrigeration system with capacity-controllable scroll compressors and microchannel condensers (with optional hot water and/or cold water extraction possible)
- → Continuously controlled recirculation heating flap
- → Shortened recuperator (960 mm shorter in length) optimal for minimum space requirement
- → Supply air humidification without unit extension
- → Larger air volumes on request
- → And many more



Designed to meet the requirements of the highest energy efficiency classes

Demand-controlled defrost function with low peak power

Natural refrigerants can be used

NX Adconair versions

Description

NX Adconair base model: Basic unit without additional equipment. The central element is the counterflow plate heat exchanger. Ideal application areas are those in which a high heat recovery is in the focus.

Additional equipment adiabatic evaporative cooling: Classic adiabatic evaporative cooling with temperature reduction up to 14 K (for RA=26 °C; 55 % r.h., OA=34 °C; 40 % r.h. and optimum air volume flow at standard density). The ideal application area is one with a high demand for cooling and simultaneously high demands for heat recovery, without the need for dehumidification.

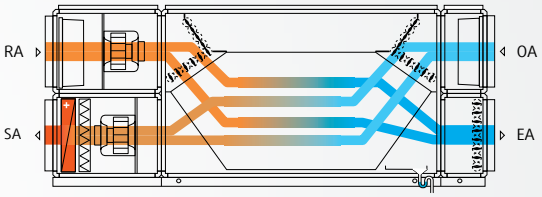
Optional: Hybrid adiabatic: By combining the processes of indirect, adiabatic evaporative cooling and dew point cooling, supply air temperatures of down to 18 °C can be achieved. This allows the high removal of high sensible heat loads from the rooms.

Optional: Adsorption cooling: Cooling is provided by an integrated, closed adsorption cooling circuit which supplies the heating coil used for supply air heating in winter with cold water for cooling in summer. As the adsorption cooling circuit is operated thermally, existing waste heat can be used efficiently.

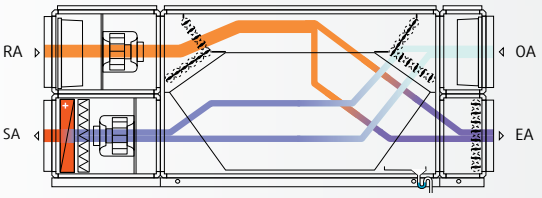
Functional description

Description

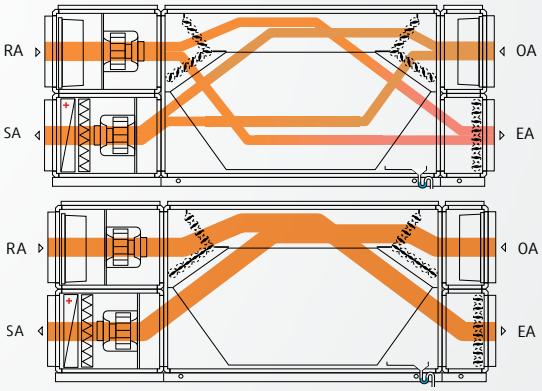
Wintertime conditions: In case of low outside temperatures the system operates completely in heat recovery mode. The counterflow plate heat exchanger enables the recovery of more than 90 % of the heat contained in the return air. The standard heating coil compensates for ventilation and transmission heat losses of the building as required.



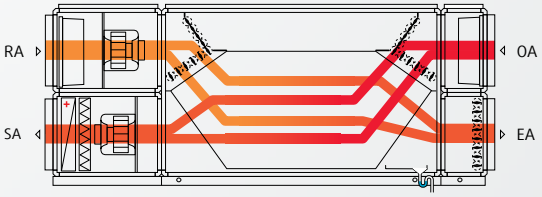
Defrosting circuit: The integrated defrosting circuit melts any ice build-up by opening the extract air-exhaust air bypass, which directs the return air straight to the area of any possible ice without interrupting the fresh air supply. In this way, the peak load on the LPHW for reheating the extremely cold outside air is significantly reduced.



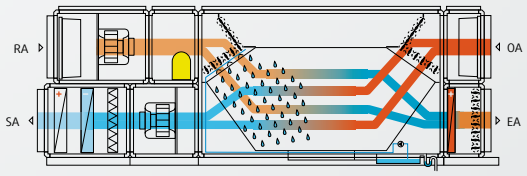
Transitional period: As the outside air temperatures rise, the heat recovery requirement is reduced. The bypass dampers, which run along the entire depth of the unit, are continuously regulated in order to achieve the desired supply air temperature. If the outside temperatures continue to rise, the heat recovery is completely bypassed. The structural design of the bypasses for both airflow paths ensures that the pressure losses within the unit are low and that the power consumption of both fans in bypass mode is also reduced to a minimum. A standard unit will spend more hours in that mode of operation than heating and cooling.



Summertime conditions: If the outside temperature rises above the return air temperature, the highly efficient heat exchanger is used as a "cooling recovery system". The warm outside air is cooled by the return air.



Compressor refrigeration system: At high outside temperatures, both the integrated adiabatic cooling and the compression refrigeration system are activated so that the supply air is cooled to the desired temperature and dehumidified if necessary. The adiabatic system lessens the load of the compression refrigeration system and increases the unit SEER considerably.



All-in-one concept: Air handling unit with counterflow plate heat exchanger

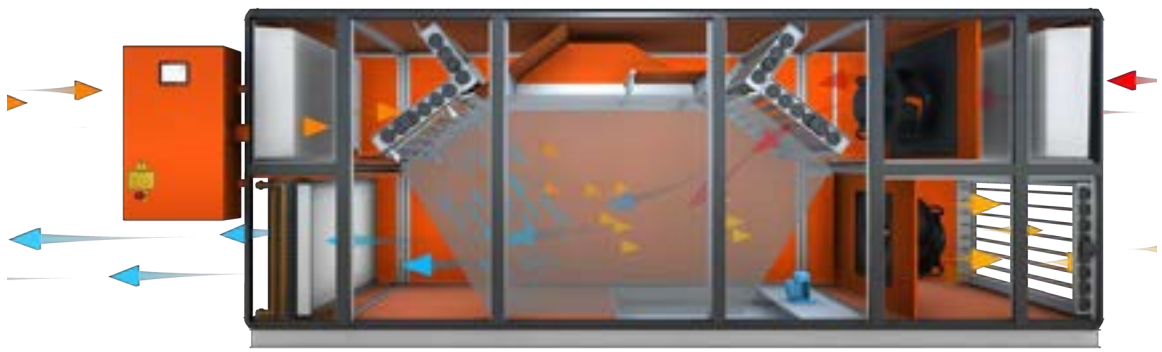
NX Adconair Adiabatic

Area of application: Production facilities, food industry, canteens, exhibition halls, commercial kitchen

Main functions of the version: An essential component of this function is the counterflow plate heat exchanger, in which the return air is cooled adiabatically.

Knowledge: In the counter flow principle, the outdoor air is cooled by the humid and cool exhaust air. Due to a complete separation of the air ways, there is no moisture transfer from the exhaust air to the supply air. The high efficiency is based on the fact that both processes of the adiabatic evaporative cooling of the return air and the cooling of the outside air, take place within the heat exchanger simultaneously. The high temperature efficiency of this plate heat exchanger and the high counterflow proportion of > 80 % ensure a high cooling effect. In this way, a large cooling capacity of the outdoor air, or more than 14 K can be achieved. This variant can be extended by an integrated compression refrigeration system. It is switched on at high outside air temperatures in order to cool the supply air to the desired temperature.

- No additional air-side pressure drop resulting from components installed in the air path, e.g. humidifiers
- Cooling of outdoor air by up to 14 K possible
- Adiabatic cooling efficiency Φ_{Adi} > 90 %
- Operation with rain water possible
- Supply air humidification of up to 2-3 g/kg possible
- Great output, even with high internal thermal loads
- Reduction of the required DX cooling duty by up to 70 %
- Minimal water consumption of 2.2 l/person & day during summertime



All-in-one concept: Air handling unit with counterflow plate heat exchanger

NX Adconair Adiabatic^{zeroGWP}

Area of application: Production facilities, food industry, canteens, exhibition halls, commercial kitchen

Main functions of the version: Within the first-half of the heat exchanger, indirect, adiabatic evaporation cooling takes place, as described in the Adconair Adiabatic systems. Outside air is therefore already extensively cooled down. In the second-half of the heat exchanger, so-called dew point cooling takes place.

Knowledge: For this purpose, a portion of the pre-cooled outdoor air is diverted after leaving the heat exchanger as process air flow. It is then directed back in to the heat exchanger in accordance with the counterflow principle and again humidified once again. In this way, indirect evaporative cooling takes place again. Unlike conventional systems, the lowest possible temperature is no longer dependent on the wet-bulb temperature of the return air, but rather on the dew-point temperature of the pre-cooled outside air. The process air flow is up to 50 % of the nominal flow and is controlled constantly such that a constant supply air temperature is maintained. This duty impact must be considered during the design phase.

- Low water consumption of 3.6 l/kWh
- No need for a conventional refrigeration system
- Adiabatic cooling efficiency > 115 % (based on the wet-bulb temperature of the extracted air)
- Great output, even with high internal thermal loads
- Minimal power consumption with a SEER of 36
- Adiabatic operation with rain water possible
- Cooling of outdoor air by up to 20 K possible
- Rising humidity of the return air does not result in notable power reduction

All-in-one concept: Air handling unit with counterflow plate heat exchanger

NX Adconair AdiabaticDX^{carbonfree} thermally

Area of application: Production facilities, food industry, canteens, exhibition halls, commercial kitchen

Main functions of the version: The key components of this system consist of two modules, which are equipped with silica gel as an adsorption material.

Knowledge: The physical process of adsorption produces cold water, which is used in a change-over coil to cool and dehumidify the supply air. The flow temperatures from the refrigeration circuit are low enough to cool the outside air from 32 °C down to around 16 °C, in combination with indirect, adiabatic evaporative cooling.While one module generates the cold water by this process, the second module is regenerated. For this purpose, hot water (from 55 °C) is applied, which leads to desorption of the saturated silica gel. The desorption is at least as fast as the adsorption, so that enough cooling energy is always available.The special feature of this concept is that there are no mechanically moving parts in the vacuum and the noise level is extremely low and vibration-free compared to conventional compressors.

No certified refrigeration technicians for maintenance needed

Hydraulically separated heat and cold supply, no mixing possible

Minimal water consumption of 2.5 l/person & day during summertime

No additional energy consumption for supply air cooling and dehumidifying

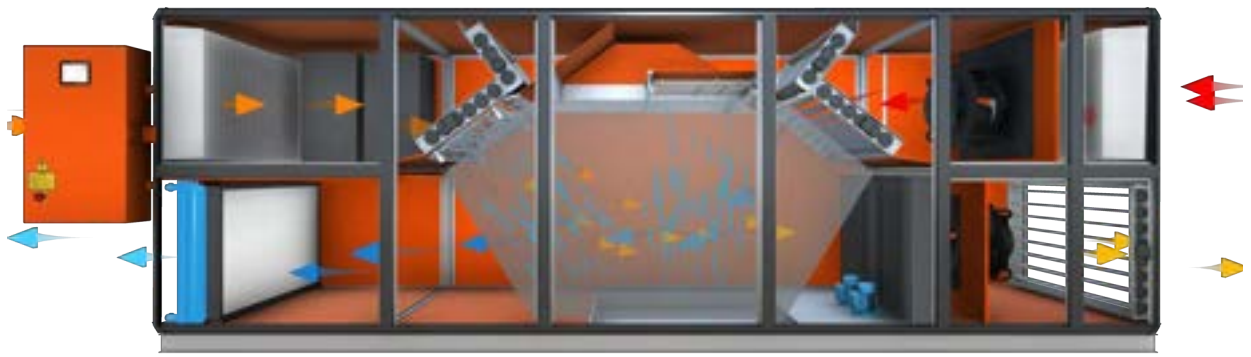
Is not subject to the F-Gas regulation

Adiabatic operation with rain water possible

FC-free, as water is used as refrigerant with GWP = 0

Operating heat for adsorption process from 55 °C

Possible energy sources: solar heat, district heating, waste heat from combined heat and power plants, process heat



***IBVTIKON** - Application area: office and administration buildings, Germany*

All-in-one concept: Air handling unit with double plate heat exchanger and adiabatic evaporative cooling

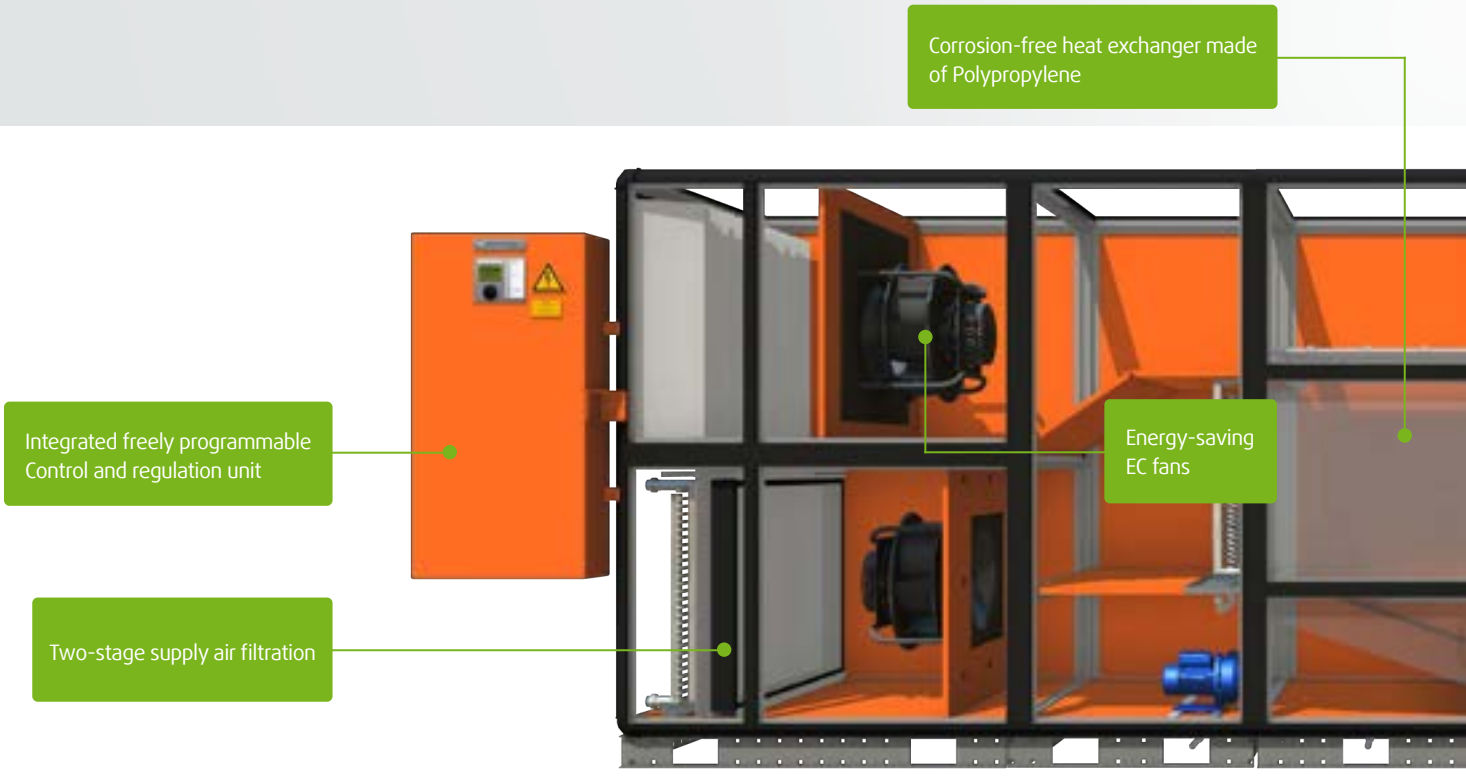
NX Adsolair

Area of application: Laboratories, commercial kitchens, production facilities with contaminated exhaust air, data centres

Main functions: Complete unit ready for connection, contains all components for low energy ventilation, including all switching and control elements.

Knowledge: Requirements with high thermal loads can be ideally met with the different cooling options of the units in series Adsolair. Series 56 uses adiabatic evaporative cooling an achieves to cool up to 12 K (at OA = 34 °C / 40 % r.h.) with water. The total cooling capacity is further enhanced with an integrated compression refrigeration system.

Air volume flow:
2,200 – 40,800 m³/h



Additional details

Included performance parameters:

- → Filtering of the air in every operating mode
- → Corrosion-free heat exchanger made of Polypropylene
- → Pump hot water heating coil
- → Thermal bridge factor TB1
- → Individually adjustable performance parameters
- → Intensive quality testing with factory test run

Additional options:

- → Recirculation heating damper
- → Pump cold water cooling coil (Series 56)
- → Pressure reversal
- → Attenuator
- → Reversible refrigeration system (Series 58)
- → Outdoor installation
- → Hot water extraction to use the waste heat for heating purposes (Series 58)
- → Increase in cooling capacity
- → Remote maintenance
- → Larger air volumes on request
- → And many more

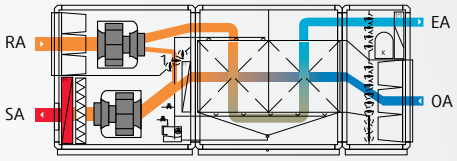
[1] Dependent on configuration of measurement and control system/unit

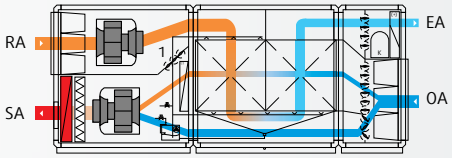
Functional description

Description

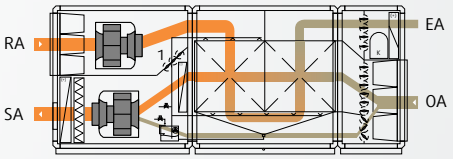
Wintertime conditions: In case of low outside temperatures the system operates in full heat recovery mode. The standard heating coil (LPHW) compensates for ventilation and transmission heat losses of the building as required.



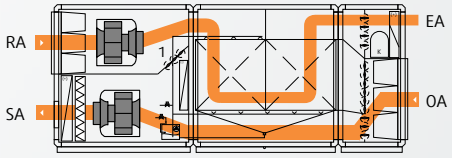
Defrosting circuit: All recuperative heat exchangers tend to ice over in the exhaust air section with low outside temperatures. In defrost operation, the OA-SA bypass opens, reducing the outside air flow rate going through the recuperator. The heat contained in the return air melts any ice in the heat exchanger, while the airflow rate routed through the recuperator is regulated as required.



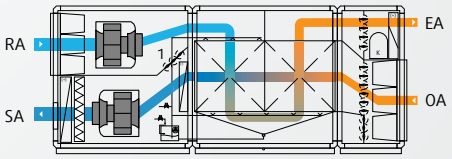
Transitional period: As the outside air temperature rises, the heat recovery demand is reduced. The OA/SA bypass damper, which runs the entire depth of the unit, is continuously regulated in order to achieve the desired supply airtemperature.



Free cooling: If the outside temperature continue to rises, the heat recovery is bypassed. The structural design of the OA/SA bypass ensures that the pressure losses within the unit are low and that the power consumption of both fans in bypass mode is also low.



Summertime conditions: If the outside temperature rises above the return temperature, the highly efficient heat exchanger is used as a „cooling recovery system". The warm outside air is cooled by the return air.



Indirect adiabatic evaporative cooling: The Menerga Adsolair principle uses the advantages of indirect adiabatic evaporative cooling without the disadvantages of supply air humidification. A major component of the Adsolair principle is the double plate heat exchanger, in which the return air is adiabatically cooled. In return, the outside air is cooled by the humid, cold exhaust air, without being humidified. The high efficiency rate lies in the fact that both processes (adiabatic evaporative cooling of the return air + cooling of the outside air) take place simultaneously in the heat exchanger. The high degree of temperature efficiency of the double plate heat exchanger allows significant cooling of the OA-SA by over 12 K (at OA = 34 °C / 40 % r.h.). If required, the compressor refrigeration system will switch on and cool the supply air even further.

***Fensch GmbH** - Specialists for high-quality and particularly long-lasting LED luminaires, Germany*

All in one concept: Air handling unit with highly efficient regenerative accumulators

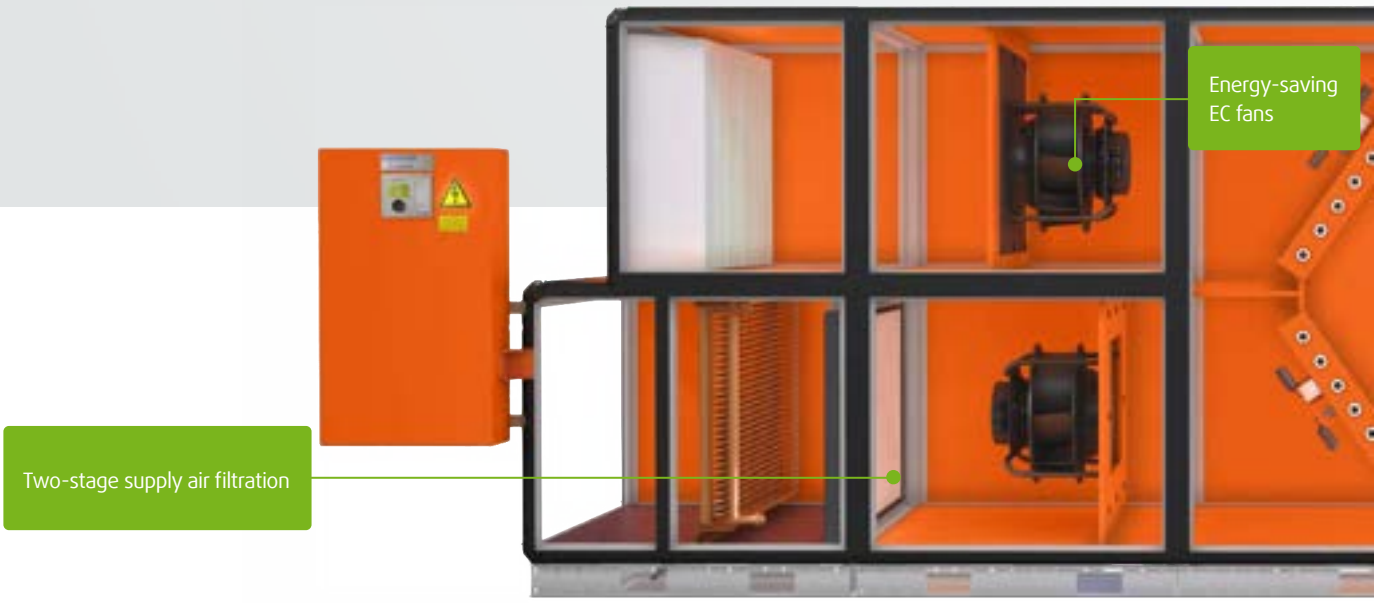
NX Resolair

Area of application: Warehouses, production halls, exhibition halls

Main functions: Units in the NX Resolair series operate with medium and large air volumes with the advantages of regenerative heat recovery.

Knowledge: Capable of more than 90 % heat recovery and up to 70 % moisture recovery enabling a comfortable climate with the lowest energy costs. Due to the very high heat recovery, an external heat supply can be eliminated in many cases. The units have a very high degree of flexibility with regard to partitioning, extensions and optional functions, among other things due to their modular design.

Air volume flow:
3,900 – 51,000 m³/h



Additional details

Included performance parameters:

- → Filtering of the air in all operating modes
- → Cycle time change for modes between bypass and free cooling
- → Integrated bypass function
- → Thermal bridge factor TB1
- → Individually adjustable performance parameters
- → Complete unit ready for connection, Contains all components for low energy ventilation, including all switching and control elements
- → Intensive quality test with factory test run

Options:

- → Recirculation heating damper
- → Heating coil
- → Attenuator
- → Type-tested (PED 2014/68/EU) compression refrigeration system with capacity-controllable scroll compressors and microchannel condensers (with optional hot water and/or cold water extraction possible)
- → Outdoor installation
- → Remote maintenance
- → Double deptionaccumulator for enhanced heat recovery
- → and many more

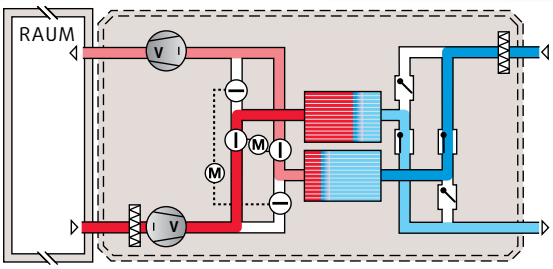
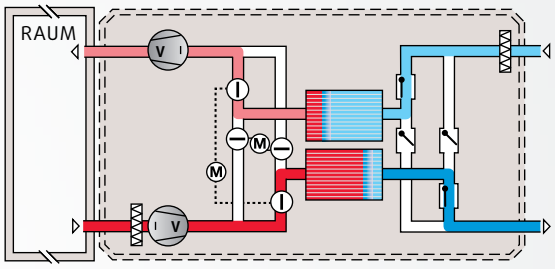
Functional description

Cycle 1



Cycle 2



The unit contains two accumulator blocks with highly sensitive accumulator mass, through which the outside and return air pass alternately. The accumulator mass is able to capture heat from a warm air flow very rapidly and transferring this just as rapidly to the cold air flow.

A damper system is installed upstream and downstream of the accumulators. The exhaust/supply air system is driven by electric motors, the outside/exhaust air system works dynamically. The fans in the extract air and supply air sections simultaneously more cold outside air through one package block and warm extract air through the other. The heat from the extract air is stored in one block, while at the same time the heat stored in the other one is released to the outside air.
The temperature efficiency of the regenerative energy exchanger is over 90 %. The unit thus recovers almost all the heat energy of the extract air. This means that a supply air reheating coil is not required if static heating is present or the transmission heat demand is covered by the internal heat load. Despite the very high heat recovery efficiency of the Resolair series, no defrosting operation is necessary due to the regenerative heat recovery system used. The additional heating capacity normally needed is not required in this case.

Under winter conditions, the humidity recovery of the regenerative heat recovery system is up to 70 %, which in most applications makes an additional humidification system unnecessary.

Where outside air temperatures are rising, variable alteration of the switching cycles allows heat recovery to be reduced all the way to the point of free cooling.

If the outside temperature exceeds the room air temperature, the unit switches back to basic operation and then operates in „cooling recovery mode“ with the same high efficiency as in heat recovery.

To remove higher internal heat loads at high outside air temperatures, the integrated compression refrigeration system is switched on (series 68).

Office building "etrium" - has been awarded the golden seal of quality by the German Sustainable Building Council (DGNB). The building is tempered by a Resolair central ventilation unit from Menerga, which is equipped with a highly efficient heat recovery system and supplies the individual building sections with an air volume flow of up to 14,000 m^3/h. Via two heat packages with highly sensitive accumulator mass, the system can very quickly absorb the heat present in the extract air flow and just as quickly release it again to the cold supply air.

Area of Application: Special Solutions

Unit overview

Products at a glance
To help you understand the application range of our products at a glance, we have created an evaluation table to help you make the right choice for your individual requirements.

This evaluation table is designed to help you select the right ventilation solution for your specific requirements. If you have any questions or are unsure, our experts will be happy to help you with your decision.

Menerga rating system
Good: This rating indicates that our air handling units perform solidly in this application area. They meet basic requirements and are a reliable choice for normal applications.

Excellent: Air handling units with this rating exceed the standards and offer above-average performance in this area. They are ideal for situations where improved efficiency and performance is required.

Best in Class: Our air handling units with this rating represent the ultimate in this application area. They offer outstanding performance, innovative technology and maximum efficiency. If you are looking for the best of the best, these are the solutions to meet your needs.

Tailored ventilation solutions

Outstanding technology for special requirements

In the midst of the diverse demands placed on us by the modern world, we at Menerga have created a vision that is second to none. Our products and solutions not only meet standards, but also excel in extraordinary scenarios - in environments where climatic conditions are not only a challenge, but also an opportunity for the highest performance. Here, we understand that no two environments are alike, and that's why we specialize in creating customized solutions that fit seamlessly into the specifics of each industry.

Cooling | Dehumidify | Ventilate | Precise temperature conditions

Food Industry
Our ventilation technology for the food industry not only ensures precise temperature and humidity control, but also meets the highest hygiene standards. From preserving fresh produce to supporting food safety, we offer solutions that meet the unique needs of this demanding industry.

Archives
An optimal environment is critical for the preservation of valuable documents and artifacts. Our archives ventilation technology provides stable temperature and humidity conditions to preserve cultural heritage and sensitive information.

Datacenter
Climate control in data centers is essential. Our technology ensures precise cooling and heat dissipation to create a stable environment for sensitive IT infrastructures. We maximize the energy efficiency and performance of your data centers with innovative solutions.

Ventilation with polluted exhaust air
In areas with polluted air, we develop solutions that improve air quality and effectively remove harmful particles. Our advanced filtration systems ensure a healthy and safe working environment.

Process cooling
Our process cooling ventilation technology not only optimizes thermal control, but also increases the

efficiency of industrial operations. We provide solutions that ensure precise cooling and temperature management.

Ice halls
Optimal climatic conditions are crucial here. Our ventilation technology provides precise control of ambient temperature and humidity to ensure ideal ice skating conditions. From preventing condensation to creating a comfortable atmosphere, Menerga offers customized solutions that enhance the skating experience every season.

Bakeries
Precise climatic conditions are essential in bakeries. Our specialized ventilation technology ensures optimal humidity and temperature to preserve the quality of your baked goods. We understand the requirements of the industry and offer solutions that meet the specific needs of bakeries.

All in one concept: Air dehumidification unit with cross counterflow plate heat exchanger and heat pump

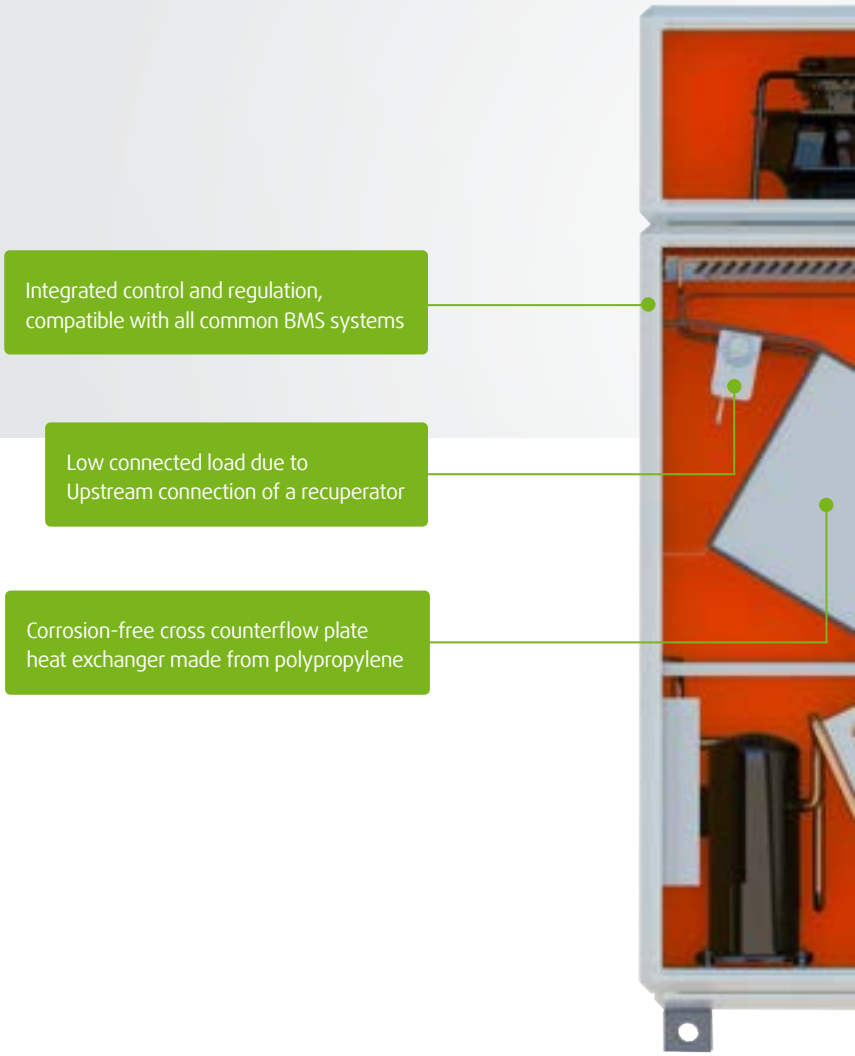
Drysolair

Area of application: Ice rinks, food production, fish farms, pharmaceutical industry, greenhouses, wood processing industry, bakery

Main functions: Complete unit ready for connection, includes all components for air dehumidification for all drying applications with cross-flow plate heat exchanger and heat pump.

Knowledge: Units in the Drysolair series were developed especially for discharging high levels of internal moisture to the atmosphere. Through the pre-cooling in the recuperator of the air to be dried, the unit works with considerably lower compressor performance than a simple heat pump system and creates a consistently good climate in ice rinks, the drying of buildings or industrial drying processes. The combination of first-class components with precise control and regulation guarantees economical operation at all times and adjusts the temperature and humidity as required.

Air volume flow:
1,000 – 6,000 m³/h



Additional details

Included performance parameters:

- → Specific power consumption of less than 500 Wh/kg dehumidification capacity
- → Air filtration
- → Corrosion-free heat exchanger made of polypropylene
- → Individually adjustable performance parameters
- → Complete unit ready for connection, contains all components for industrial air-conditioning, including all switching and control elements.
- → Intensive quality testing with factory test run

Additional options:

- → Room humidity control
- → Hot water condenser
- → Remote maintenance
- → And many more

All in one concept: Air dehumidification unit with cross counterflow plate heat exchanger and heat pump

All technical data relate to optimum flow rate through heat recovery system and the air inlet conditions specified above and at standard density (1.204 kg/m^3).

Functional description

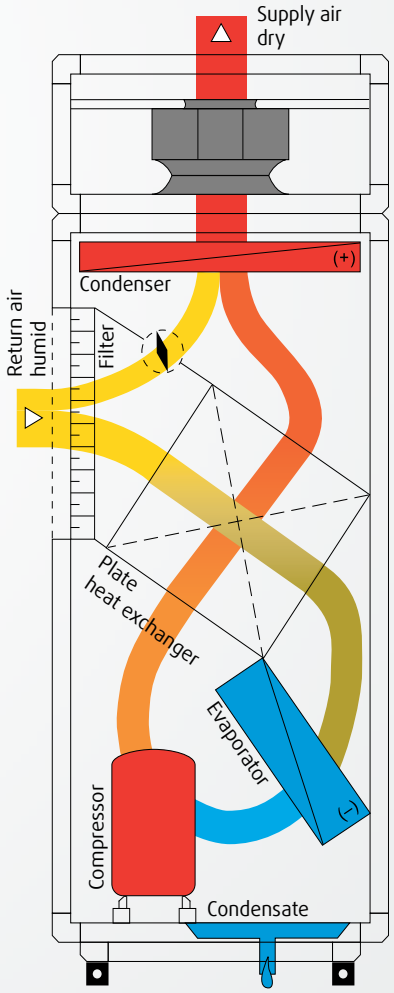
In recirculation mode humid air is dehumidified in two stages and supplied into the room as dry supply air. The return air is pre-cooled and dehumidified in the plate heat exchanger.

Climate solution from Menerga

The dehumidification to the desired supply air humidity level takes place by means of cooling the air to below its dew point in the evaporator of the heat pump. The air that has been dried in this manner is then warmed back up again in the condenser of the heat pump using its own heat, which was removed during cooling, and is brought to the required condition. The pre-cooling in the plate heat exchanger of the air to be dried means that the air dehumidification unit operates with a considerably lower compressor performance and hence a significantly lower energy consumption than a simple heat pump solution. The integrated bypass allows fast and precise control and adjustment to the condition of the return air. The cooling capacity is thus continuously adapted to the respective requirements.

Specific dehumidification energy requirement

Drysolair achieves a specific dehumidification energy requirement of far less than 500 Wh/kg. With one kilowatt hour of electrical energy, it is therefore possible to remove more than 2 kg of humidity from the recirculation air. In contrast, classical solutions without integrated heat recovery systems reach peak values in excess of 1,000 Wh/kg.



All-in-one concept: For commercial kitchens and rooms with polluted exhaust air

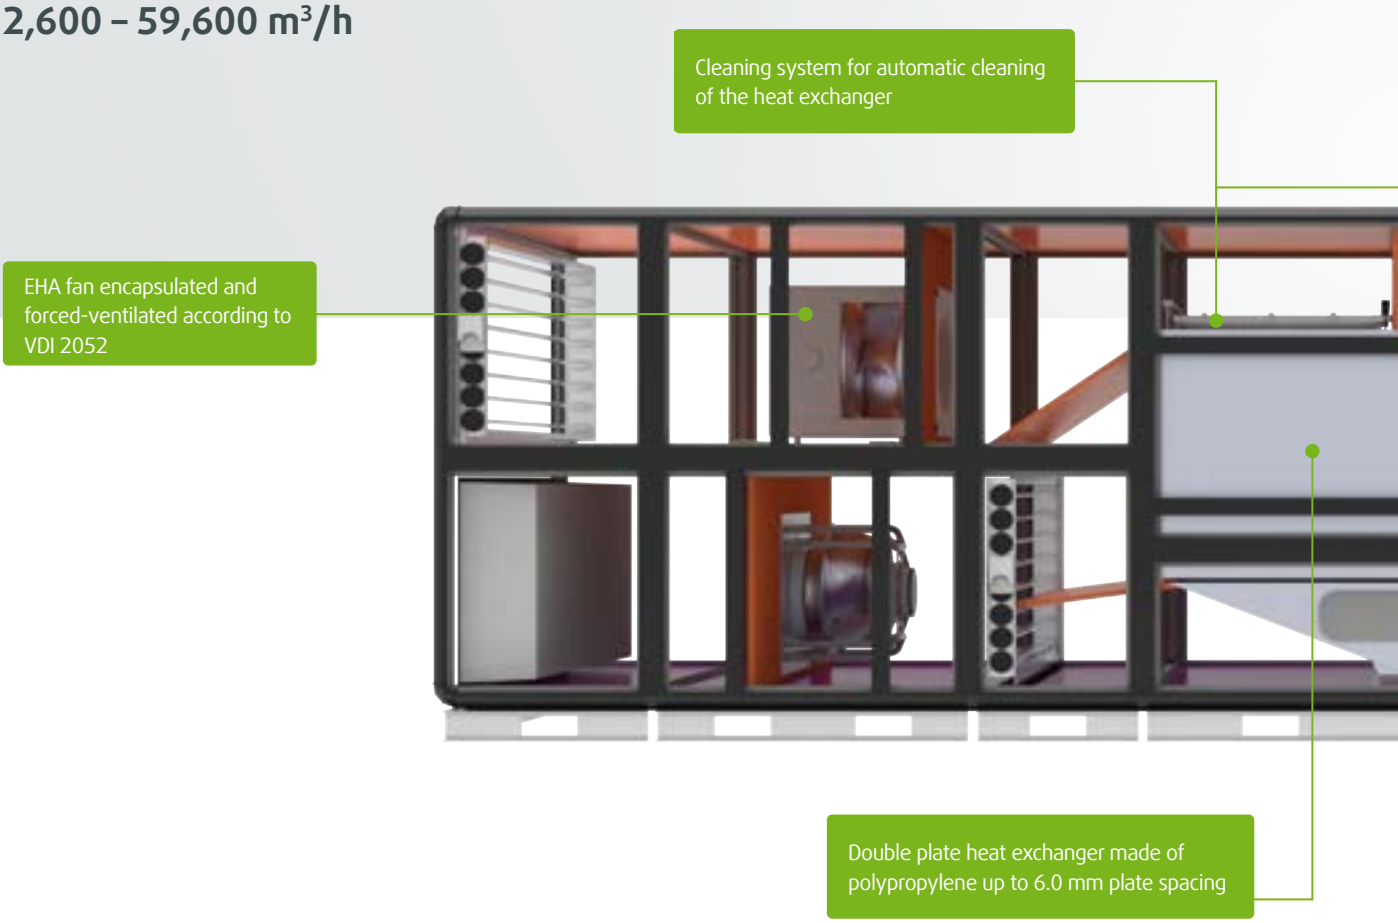
NX Adsolair Commercial kitchen

Area of application: Commercial kitchens, rooms with polluted exhaust air

Main functions: The integrated cleaning system reliably prevents and removes grease deposits from accumulating in the heat exchanger. A special cleaning fluid is sprayed directly into the exhaust air path of the heat exchanger, which removes all residues from the plates. The three filter stages of the exhaust air installed in series separate grease, oil, aerosols, dirt, dust and odours to a large extent.

Knowledge: Our all-in-one concept for the ventilation of your commercial kitchen. The tasks of the NX Adsolair: Efficient and precise supply air cooling, as well as dehumidification if required, and innovative reheating of the dehumidified supply air by using the condensation heat of the cooling system. The remaining residual heat can also be used to heat the building.

Air volume flow:
2,600 – 59,600 m³/h



Additional details

Other included performance parameters:

- → Double plate heat exchanger in which the extract air is adiabatically cooled.
- → To meet comfort criteria, the adiabatically cooled supply air is additionally dehumidified by a air cooler
- → Encapsulation and forced ventilation of the exhaust air fan unit
- → Cleaning system that prevents the deposit of grease, oil and aerosols
- → Grease collection tray is cleaned and drained via washing drains
- → Triple filter
- → Double plate heat exchanger, heating coil, adiabatic cooling and cooling cooler

Innovation for the Future

At a glance: Orange is green

At a glance

We have been committed to environmentally friendly solutions since our inception. At Menerga, we are continuously committed to green technologies that have a positive impact on our environment. An important part of our sustainable mission is the use of natural refrigerants in our air handling units.

At Menerga, we embody the spirit of future-proofing, paving the way for a greener and more sustainable future. Our commitment to cutting-edge innovation, certified solutions, adaptability and consistent customer focus means we are well equipped to meet the ever-changing demands of the market, demanding customers and environmental regulations.

1. **Use of Natural Refrigerants:**
Menerga consistently employs natural refrigerants. These refrigerants have minimal environmental impact, do not contribute to ozone depletion, and have a low greenhouse effect. Avoiding fluorinated hydrocarbons (F-gases) significantly reduces the CO_2 footprint and supports the fight against climate change.

2. **Energy-Efficient Technologies:**
Menerga relies on state-of-the-art technologies that ensure high energy efficiency. By using advanced components and intelligent designs, customers can benefit from lower energy costs and reduced energy consumption.

3. **Focus on Air Quality:**
In addition to air conditioning, Menerga places special emphasis on indoor air quality. Their innovative solutions guarantee a continuous supply of fresh air and efficient removal of pollutants, creating a healthy indoor environment.

4. **Sustainable Customer Solutions:**
Menerga develops tailored air conditioning solutions that meet customers' individual requirements and needs. Integrating sustainability throughout every phase of the project enables customers to implement eco-friendly and long-lasting solutions.

5. **Contribution to Environmental Protection:**
By using natural refrigerants and energy-efficient technologies, Menerga actively contributes to environmental protection. Reducing emissions and responsible resource management are central to the company's philosoph

6. **Adaptability and Innovation:**
Menerga continuously invests in research and development to create innovative solutions that align with the latest technological advancements. This adaptability allows the company to respond to changing customer needs and market conditions, positioning itself as a leading player in the industry.
